(15.025 psia). Some 40 million Mcf of this amount is sold under 10 contracts at 15 cents, and some 6 million Mcf is sold under 5 contracts at 15.384 cents. The remaining contracts involve sales of lessor amounts at 10 cents, 11 cents, 11.65 cnets and 12 cents. The most recently certificated sales are those at 15.384 cents. This price level was established by the Commission in *Humble Oil & Refining Co., et al.*, 24 FPC 191 (August 9, 1960), a case involving three of the producer applicants in the instant proceeding and the sale of gas from some of the same units and subject to the same conditions of production and operation as are found in the present case. In the *Humble* case, the Commission found that the proposed price of 16 cents per Mcf for gas delivered to El Paso at 860 pounds pressure was higher than required by the public convenience and necessity, and the certificates issued were conditioned upon the filing of a price of 15.384 cents per Mcf. Clearly this price, as shown on this record, as found by the examiner, and as reflected by the Commission's policy statement are ceiling, represents the price line to be held by the Commission in this case in the absence of compelling evidence to show that a higher price is required by the public convenience and necessity.

To justify their proposed contract price in this proceeding, the producers have presented an economic study which purports to show the reasonable financial requirements of the industry. This economic evidence consists of charts and tables setting forth certain supply, demand, cost, revenue, and market price trends based on data compiled from the Census of Mineral Industries, United States Bureau of Mines, Mineral year book, and various trade publications for (1) the entire United States; (2) the States of Colorado, Montana, Utah and Wyoming; (3) the States of Kansas, New Mexico, Oklahoma, and Texas; and (4) a combination of the eight named western states.

The producers' witness, in presenting the foregoing evidence, stated that costs incurred by the producers for the specific supplies committed to El Paso in this proceeding are meaningless for the purpose of testing the appropriateness of the initial price, and that the appropriate price must be determined on the basis of the financial requirements of the industry as related to certain trends on an area basis. In his opinion, however, industry revenue requirements cannot be related to area prices except through the mechanics of the competitive market system. Thus the producers take the position that because the trends presented show a decline in productivity per foot drilled, an increase in cost of production, and a decline in the ratio of new supply to net production, present gas prices are not high enough to furnish producers with the incentive to find, develop, produce and market sufficient quantities of gas to meet consumer demand; and that prices should be allowed to increase until they are high enough to bring forth the supplies needed to equal demand and the foregoing trends are reversed.

Under the theory advanced by the producers, the economic evidence presented could be used to justify any price which might be thought to be required as an incentive to bring adequate supplies of new gas to the interstate market, and which has been negotiated at arms length in a competitive market. To accept the producers' contract price on this theory of regulation would be tantamount to an abdication of our regulatory responsibility under the Natural Gas Act. As stated by the Court of Appeals for the Fifth Circuit in *U.G.I.* v. *F.P.C.*, *supra*, ". . . the only justification for giving the Commission the duty to regulate prices was the determination by Congress that the producers have a supply that is so restricted in relation to demand that they have the economic power to bargain for prices that will be injurious to the public." To preside over a rising spiral of prices as dictated by competition in the open market and the trends associated with that market is to forego regulation of producer prices in the public interest,

and would hardly be consistent with that "real administrative effort to hold back prices" which the Supreme Court of the United States has demanded of us. See *P.S.C.* v. *F.P.C., supra.*

The evidence presented by the producers in this proceeding offers no substantial, let alone compelling, proof of the public's need to have the gas supplies here involved certificated for sale at the proposed contract price, or any initial price in excess of the in-line price of 15.384 cents per Mcf. The evidence does not show that the 15.384-cent price is inadequate to stimulate continued exploration and development of new reserves in Wyoming. The trends portrayed in the economic study presented by the producers do not necessarily bespeak the necessity for us to provide an increased incentive for exploration and development in the Wyoming Area or more particularly in the Green River Basin of southwest Wyoming where the gas in this case is being produced. As noted before, the gas purchased by El Paso in southwest Wyoming is delivered to markets served by its Pacific Northwest pipeline. However, no evidence as to the demand for gas in these markets has been presented, nor is there a showing that the development of new reserves to serve these markets is not progressing at a rate sufficient to meet the present or future needs of the area. On the other hand there is evidence to show that price levels in the four Mountain States have been adequate consistently to call forth new reserves which are more than double the production of the region; and that El Paso is apparently satisfied that exploration in this area is going along as well as can be expected.

With respect to the use of trend evidence, it is impossible to draw any easy conclusions as to what particular trends may mean in terms of price. Thus a trend which shows reserves increasing at a declining rate in relation to the demand for gas does not require a conclusion that there is insufficient price incentive and profit potential. Exploration and development may well be continuing at a reasonable pace, even though the discovery of new reserves may appear to lag behind the demand for additional gas. Furthermore, any judgment with respect to the rate of exploration and development since 1954, as indicated by historical trends, must be tempered by the understanding that such trends reflect in some degree past uncertainty among producers as to the course which producer regulation would take after the Supreme Court's decision in the Phillips case.[2]

The trend evidence presented by the producers in this proceeding is not sufficient to permit us to draw any conclusions therefrom with respect to the initial contract price here proposed. Without some substantial proof of how this general economic data, applicable to the industry as a whole over wide geographical areas, can be related to and utilized in support of the specific price proposed for these sales in this particular area, such evidence has no real probative value. There is no evidence in the record before us which compels a finding on our part that the producers' initial contract price is required by the public convenience and necessity; and, we conclude, as did the examiner, that the certificates herein issued should be conditioned upon the filing of an initial price not in excess of the in-line area price of 15.384 cents per Mcf, as reflected in the ceiling level for the Wyoming Area established by the Commission's *Statement of General Policy No. 61–1.*

With respect to Pan American's application, we agree with the finding of the examiner that Pan American has rendered itself unable to perform the services for which it seeks a certificate by reason of the transfer of its producing properties to Belco. In the absence of a finding of its ability to perform, Pan American's certificate application must be denied and the temporary authorization

[2] *Phillips Petroleum Co.* v. *Wisconsin,* 347 U.S. 672.

heretofore issued must be rescinded. Such other issues as have been presented, are properly disposed of in the examiner's decision; and to the extent that his decision with respect to these issues, as well as the issues heretofore discussed, is consistent with this opinion and order, we adopt his decision as our own. We would note, however, that the examiner erred in referring to and citing our decision in *Alfred C. Glassell, Jr., et al.*, 25 FPC 1071. This case does not stand for the proposition that trend evidence is unacceptable in producer rate proceedings under Sections 4 and 5, as indicated by the examiner. As the language cited by the examiner shows, the issue there considered was whether the Commission should depart from long established original cost concepts in determining the rate base of natural-gas companies, or should use trended costs or reproduction costs for that purpose. This discussion of rate base is wholly within the context of a cost of service approach to the determination of just and reasonable rates, and relates to the computation of a proper return to be included in the cost of service. The *Glassell* case in no way bears upon the use of trend evidence in either rate proceedings or certificate proceedings for the purpose of justifying rates on some basis other than the traditional rate base cost of service approach.

The Commission further finds:

(1) El Paso is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission.

(2) El Paso's proposed facilities hereinabove referred to, and more fully described in its application, will be used in the transportation and sale of natural gas in interstate commerce, subject to the jurisdiction of the Commission; and such facilities, together with the construction and operation thereof, are subject to the requirements of subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Humble, Belco, and Beneficial, independent producers of natural gas, are now, or upon initiation of the proposed sales to El Paso will be, "natural-gas companies" within the meaning of the Natural Gas Act, and are, or will be, engaged in the sale of natural gas in interstate commerce for resale for ultimate public consumption, subject to the jurisdiction of the Commission.

(4) The sales of natural gas proposed by Humble, Belco, and Beneficial, hereinabove referred to, and more fully described in their applications, are subject to the jurisdiction of the Commission, and such sales, together with the construction and operation of any facilities subject to the jurisdiction of the Commission necessary therefore ,are subject to the requirements of subsections (c) and (e) of Section 7 of the Natural Gas Act.

(5) Subject to the requirements of our order herein and the conditions attached to the certificates herein issued, El Paso, Humble, Belco, and Beneficial are able and willing properly to do the acts and to perform the services proposed, and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(6) The construction and operation of the facilities proposed by El Paso, and the sales proposed by Humble, Belco, and Beneficial, together with the construction and operation of any facilities subject to the jurisdiction of the Commission necessary therefor, are required by the public convenience and necessity upon the conditions hereinafter set forth, and certificates should be issued to each of them as ordered below.

(7) The application for a certificate of public convenience and necessity filed by Pan American should be dismissed, and the temporary authority heretofore granted should be rescinded.

(8) The conditions attached to the certificates herein issued are required by the public convenience and necessity.

(9) Except as herein granted, the exceptions to the examiner's decision should be denied.

The Commission orders:

(A) Certificates of public convenience and necessity are hereby issued, upon the conditions hereinafter set forth, to El Paso for the construction and operation of the facilities proposed, as more fully described above and in its application; and to Humble, Belco, and Beneficial for the sale of natural gas in interstate commerce for resale as proposed, and for the construction and operation of any facilities subject to the jurisdiction of the Commission necessary therefor, as more fully described above and in their applications.

(B) The certificates herein issued to Humble, Belco, and Beneficial are granted upon the express condition that the initial price for the proposed sale of gas to El Paso shall not be in excess of 15 cents per Mcf at 14.65 psia (15.384 cents per Mcf at 15.025 psia), and that said producer applicants shall file supplements to their presently filed rate schedules reflecting the conditioned price as their initial price in lieu of the initial price provided in their contracts with El Paso. The initial price as so conditoned and made a part of the producers' filed rate schedules shall be applicable to all of the gas delivered to El Paso under the certificates herein issued regardless of delivery pressure.

(C) The certificates herein issued, and the rights granted thereunder, are conditioned upon compliance by the applicants with all applicable Commission Regulations under the Natural Gas Act and are without prejudice to any action the Commission may determine to be necessary or appropriate as a result of the outcome of *United States* v. *El Paso Natural Gas Company and Pacific Northwest Pipeline Corporation*, Civil No. 143-57 (D. Utah).

(D) The certificates herein issued are not transferable and shall be effective only so long as each of the applicants continues the acts and operations hereby authorized in accordance with the provisions of the Natural Gas Act and the applicable rules, regulations and orders of the Commission.

(E) The grant of the certificates herein shall not be construed as a waiver of the requirements of Section 4 of the Natural Gas Act, or of Part 154 of the Regulations thereunder. Such grant is without prejudice to any findings or orders which have been or may hereafter be made by the Commission in any proceeding now pending or hereafter instituted by or against the applicants. Further, the action in this proceeding shall not foreclose nor prejudice any further proceedings or objection relating to the operation of any price or related provision in the gas purchase contracts herein involved.

(F) The application for a certificate of public convenience and necessity filed by Pan American is hereby denied, and the temporary authorization thereunder heretofore issued to Pan American is hereby rescinded.

(G) Except as herein granted, the exceptions to the examiner's decision are hereby denied.

DECISION

UPON APPLICATION FOR CERTIFICATES OF PUBLIC CONVENIENCE AND NECESSITY PURSUANT TO SECTION 7(c) OF THE NATURAL GAS ACT

(Issued August 25, 1961)

KURTZ, *Presiding Examiner:* These proceedings involve applications for certificates of public convenience and necessity filed pursuant to Section 7(c) of the Natural Gas Act. Pan American Petroleum Corporation (Pan American),

Humble Oil & Refining Company (Humble), Belco Petroleum Corporation (Belco), and Beneficial Oil Company (Beneficial), hereinafter sometimes referred to as producers, seek permanent certificates to sell to El Paso Natural Gas Company (El Paso) natural gas produced from certain acreage in Sublette and Lincoln Counties, Wyoming, at an initial maximum price of 18½ cents per Mcf, at a pressure of 15.025 psia, as set forth in gas purchase contracts between the parties. El Paso in turn seeks a permanent certificate to construct and operate facilities necessary to the purchase of this natural gas for transportation and resale to its existing markets.

Pending determination of the applications, temporary certificates for the authorization as requested in the above applications have been issued to all of the applicants on a condition that the initial rate to be charged El Paso by the producers shall not exceed 15 cents per Mcf at a pressure of 14.65 psia (15.384 cents at 15.025 psia) for gas delivered. Each of the above producers has signified its acceptance of the rate condition as set forth in the temporary certificates issued for deliveries of gas that are now being made to El Paso.[1]

Intervening in these proceedings are: the People of the State of California and the Public Utilities Commission of the State of California (State of California); the Pacific Gas & Electric Company (PG&E); and the Southern California Gas Company and Southern Counties Gas Company of California (Southern California), hereinafter sometimes referred to as interveners. The interest of these interveners relates to the rate proposed to be charged by the producers for natural gas to be sold to El Paso.

The interveners and staff counsel urge that the maximum initial rate to be charged by the producers for natural gas sold to El Paso should not exceed 15 cents per Mcf at a pressure base of 14.65 psia. Also, the staff contends that the application of Pan American should be dismissed and the temporary certificate issued to this applicant be rescinded. This is concurred in by the State of California, which, in addition, contends that the provision in the contracts providing for renegotiation of the rate to be charged should be deleted therefrom. Southern California, while contending that the maximum rate should be 15 cents per Mcf at 14.65 psia, suggests that the more appropriate price would be 15 cents at 15.025 psia, and that the initial price so established be fixed as the base from which each of the several one cent escalations is to be computed.

The above applications were consolidated for hearing, and all parties, with the exception of Beneficial, participated therein. Staff counsel, and all parties, with the exception of Beneficial, filed briefs in support of their respective positions.

El Paso, a Delaware corporation, owns and operates an integrated pipeline system extending from Canada to Mexico, which is located in the States of Washington, Oregon, Idaho, Wyoming, Utah, Colorado, Arizona, New Mexico, and Texas. Its overall system requirements for natural gas are in excess of an average of 3½ billion cubic feet per day. In furtherance of this service,

---

[1] Temporary certificates were issued on November 25, 1960, pursuant to requests by: El Paso in Docket No. CP60–72 on October 12, 1960; Belco Petroleum in Docket No. C160–475 on October 11, 1960; Humble in Docket Nos. C160–65 and C160–66 on October 17, 1960, and October 20, 1960, respectively; Pan American in Docket No. G–19277 on October 31, 1960; and Beneficial in Dock No. C161–729 on November 7, 1960. Belco, on March 8, 1961, filed in Docket No. C160–475 an amendment to its application, requesting temporary certificate to make sales to El Paso from additional acreage dedicated to El Paso, such acreage having been acquired from Pan American, effective as of January 1, 1961, which temporary certificate was issued on May 19, 1961.

El Paso and its subsidiary Pacific Northwest Pipeline Corporation[2] entered into the contracts here under consideration with the producers. These contracts add an additional 240 billion cubic feet of natural gas to El Paso's claimed gas reserves at the end of 1960 of 37.7 trillion cubic feet. Under these contracts, El Paso estimates that it will purchase at this time an average of 3 to 4 million cubic feet of gas per day. The deliverability summary submitted by El Paso disclosed a capability of this acreage to deliver in excess of 25 million cubic feet per day. To secure this gas, El Paso's application discloses the necessary construction of 13.1 miles of pipeline off its existing Green River Basin lateral line to connect 13 wells. These wells are located in various operating units hereinafter named, and the units are within Sublette and Lincoln Counties, Wyoming. The total cost of additional facilities is estimated to be $449,000.

The natural gas herein proposed to be acquired by El Paso is not to be dedicated to any particular sale, class of sale or customer, and is to be used by El Paso in conjunction with its other existing gas supply in meeting system market requirements in respect to both present and future customers. El Paso considers that it has an obligation to make available a market for gas developed along its pipeline system so as to provide the stimulus for additional drilling to secure additional supplies of gas to be available when needed. As of October 12, 1960, El Paso had paid to Belco, under other gas purchase contracts in the Green River Basin, over $6 million for gas which it could not take. El Paso claims that it will be in a position to recoup this gas so as to avoid the penalty of paying for gas not taken.

Humble, a Delaware corporation, filed applications on January 19, 1960, in Docket Nos. CI60–65 and CI60–66, resulting from contracts entered into between Carter Oil Company[3] and Pacific Northwest Pipeline Corporation on August 5, 1959, and August 6, 1959, respectively. The contract of August 5, 1959, was amended by further agreements entered into on August 5, 1959, August 10, 1959, and September 9, 1959. This contract dedicates to El Paso all of the working interest in the natural gas produced from formations down to and including the Muddy Formation underlying 1,011.98 acres in the Green River Basin Unit located in Sublette and Lincoln Counties, Wyoming. The contract of August 6, 1959, was amended by agreements dated August 6, 1959, August 10, 1959, and August 31, 1959, and dedicates to El Paso all of the working interest in natural gas produced from formations down to and including the Muddy Formation underlying 4,058.60 acres in the Figure Four Canyon located in Sublette County, Wyoming, and in this unit Humble is the designated operator. These contracts cover all of Humble's interest in these two units.

Belco, a Delaware corporation, filed an application on April 13, 1960, in Docket No. CI60–475, and an amendment thereto on October 11, 1960, resulting from a contract entered into on December 10, 1959, with Pacific Northwest Pipeline Corporation, which contract was amended on September 30, 1960. This contract dedicates to El Paso a maximum of 300 billion cubic feet of economically recoverable reserves of gas with a maximum delivery of 40,000 Mcf per day from Belco's interest in natural gas underlying about 43,081 acres in

[2] Pursuant to an order by the Commission issued on December 23, 1959, in Docket Nos. G–13018 and G–13019, 22 FPC 1091, a merger was effected by and between Pacific Northwest Pipeline Corporation and El Paso whereby all of the rights, obligations, and responsibilities of Pacific Northwest Pipeline Corporation were merged into and became a part of El Paso, with El Paso being the surviving company.

[3] As of December 31, 1959, a merger was effected by and between the Carter Oil Company and Humble whereby all of the assets, liabilities, and properties of the Carter Oil Company were merged into and became a part of Humble, with Humble being the surviving company.

Sublette and Lincoln Counties, Wyoming, and as to these acres the approximate working interest owned by Belco is as follows: 100% in 24,799 acres; 50% in 6,377 acres; 40% 6,803 acres; 33% in 3,149 acres; and 25% in 1,953 acres. This acreage is located in the Green River Basin Unit, the Figure Four Canyon Unit, the Dry Piney Unit, the Rocking Chair Unit, the Carl-Pat Area, the Connelly Area, the East LaBarge Unit, and the Stead Canyon Unit. In the Stead Canyon Unit, the unitization has been terminated, and each working interest operates its own leases. Belco is the designated operator for the Green River Basin Unit, the Rocking Chair Unit, the Carl-Pat Area, the Connelly Area, and the East LaBarge Unit.

Pan American, a Delaware corporation, filed an application on August 17, 1950, in Docket No. G–19277, resulting from a contract entered into with Pacific Northwest Pipeline Corporation on June 30, 1959, which contract was amended on July 2, 1959, and on December 7, 1960. This contract dedicated to El Paso all of Pan American's share of natural gas within the formations down to and including the Muddy Formation underlying certain acreage in the Green River Basin Unit. At the hearing on this application, Pan American stated that it had agreed with Belco, on or about February 1, 1961, to a trade of assets effective as of January 1, 1961. Out of this transaction Pan American retained a 50 percent working interest in formations underlying the acreage designated in its application in the Green River Basin Unit down to the base of Mesa Verde Formation, and Belco obtained the production rights in the Frontier Formation formerly held by Pan American. The Frontier Formation underlies the Mesa Verde Formation and is the only formation from which gas is currently being produced and sold to El Paso in this unit. Pan American has no facilities to deliver gas from the retained formations, nor does it have an understanding with Belco, the operator of the unit, regarding production from the retained formations. In fact, it is not known when production will commence therefrom. Under such circumstances, the motion made by staff counsel to dismiss the application of Pan American must be granted, as no showing has been made of ability to perform. The necessary findings required under Section 7(e) of the Natural Gas Act cannot be made. The question here does not involve a dedication of land as a part of an overall proposal, but rather the ability to sell gas for which a certificate is requested.

Subsequent to the filing of the staff's and intervener's briefs, Pan American, on June 22, 1961, submitted an amendment to its application in Docket No. G–19277. This amended application purports to make the application conform to the evidence adduced during the hearing as to Pan American's interest in the Green River Basin Unit. Under Section 1.11(b), this filing is not required, nor is it necessary to pass upon the acceptability of this amendment under the disposition here made of Pan American's application.

Beneficial, a Utah corporation, filed an application on November 7, 1960, in Docket No. CI61–729, resulting from a contract for the sale of natural gas to El Paso entered into on October 1, 1960.[4] This contract recites a dedication to El Paso of 15 billion cubic feet of economically recoverable reserves of gas from its 62½ percent interest in the formations down to and including the Muddy Formation underlying 316.13 acres in Section 20 in the Green River Basin Unit and in Section 21 in the East LaBarge Unit. The remaining interest underlying this acreage in the East LaBarge Unit is held by Belco. Beneficial requested that the Commission dispose of its application under the shortened procedure provided for by Section 1.32(b) of the Commission's Rules of Practice and Procedure. This request was not granted. At the hearing Beneficial did

[4] Evidence by reference, Item "O."

not appear in support of its application. However, it did send two letters to the Commission, under dates of February 28, 1961, and March 15, 1961, setting forth its position. In these letters, Beneficial pointed out that it had only a small interest in the total area to be considered at the hearing, and that it was not economically feasible for it to be represented at the hearing, and, further, that it was in general agreement with the other applicants as to the rate to be charged for the gas sold. Staff counsel suggests that, due to the small amount of acreage involved, any determination made as to the applications of Humble and Belco be assumed to apply to Beneficial's application.

As above noted, Beneficial did accept the temporary certificate with a price condition, and this temporary also carried a condition that service, once having been commenced, could not be discontinued without permission of the Commission. Under the particular circumstances surrounding this application, the staff's position is reasonable and should be followed.

The only issue in these proceedings, as recognized by all parties, is the question of the rate to be charged by the producers for gas delivered to El Paso, except for the contention by Pan American that a certificate of public convenience and necessity, should be granted to it. The acreage from which gas is to be delivered, as above-mentioned, lies within Sublette and Lincoln Counties, Wyoming, with the gas delivered to El Paso at or near the wellhead. The going firm price for gas in this area is 15 cents per Mcf at a pressure base of 14.65 psia (15.384 cents at 15.025 psia), as evidenced by the Commission's *Statement of General Policy No. 61–1*, adopted December 30, 1960, 24 FPC 818, and the immediate prior decision of the Commission relating to this area, issued August 9, 1960, in *Humble Oil & Refining Co. et al.*, Docket No. G–13679 *et al.* (24 FPC 191), known as the East LaBarge case. No subsequent firm higher prices for gas are applicable in this area. The provisions applicable to the initial price for gas as set forth in the contracts between El Paso and the producers provide for a price of 17½ cents per Mcf at a pressure base of 15.025 psia (17.0632 cents at 14.65 psia), with an additional one cent if the gas from the wells is initially capable of producing into an 860 pound gathering system, irrespective of the pressures existing in the gathering system. The ability of the wells to so produce is not questioned even though El Paso, for the convenience of its system, is taking the gas at pressures above 500 pounds but lower than 860 pounds. Thus, the initial price here in question is 18½ cents per Mcf. The contracts further provide for the taking of certain volumes with El Paso having the right to regulate the flow of gas at the point of delivery subject to restrictions relating to the ability of the wells to produce and reservoir damage. In addition to the above, the producers will receive 30 percent of El Paso's net realization f.o.b. its Opal plant for liquids extracted from the gas sold. The contracts do not include any so-called favored nation provisions. However, if El Paso does enter into a contract containing such a provision, the Humble contracts are to be so amended. These contracts, in addition to the step increases in price, provide for renegotiation of the price on or before July 1, 1962, to the reasonable market price for gas then delivered, and the price is subject to tax adjustment provisions.

When, as here, the contract price is higher than the going firm price for gas now sold in Sublette and Lincoln Counties, Wyoming, the applicants must justify the proposed price. In *Public Service Commission of New York* v. *Federal Power Commission*, 287 F. 2d 146 (CADC 1960), *cert.* denied 365 U.S. 880, 882, the Court in referring to the *Catco* case, *Atlantic Refining Co.* v. *Public Service Commission*, 360 U.S. 378, pointed out that this decision posed for the Commission two alternative courses in cases where a natural gas company seeks certification of sales at prices which are suspiciously higher than other

or former prices in the area, or which in some way will tend to have an inflationary impact upon the natural gas market. The two courses are the attaching of conditions to protect the public interest while other rate testing procedures are in progress, and the granting of unconditional certification upon evidence sufficient to support a finding of public convenience and necessity. The Court went on to state, at page 150:

> The Catco decision does not prescribe the standard of proof which must be satisfied to support an unconditional certification. Its tenor, however, is unambiguous; the opinion expressly reaffirms that it was 'the intention of Congress that natural gas shall be sold in interstate commerce for resale for ultimate public consumption for domestic, commercial, industrial, or any other use at the lowest possible reasonable rate consistent with the maintenance of adequate service in the public interest.' *Atlantic Refining Co. v. Public Service Commission, supra*, 360 U.S. at page 388, 79 S.Ct. at page 1253. We believe that the Supreme Court meant to impress upon the Commission an interpretation of the 'public interest' which, in the context of a rising natural gas market, demands a real administrative effort to hold back prices.

No claim is made by the applicants that the going price of 15 cents per Mcf at 14.65 psia is confiscatory. In justification of the contract price, it is alleged that: the contract was entered into at arm's length, the present price is not out of line because increases have occurred in costs associated with the drilling and operation of wells, the benefits to El Paso of gas delivered at 860 pounds pressure justifies an additional one cent per Mcf over gas delivered at 500 pounds pressure, the contract price is lower than the prices paid for gas by El Paso from other sources, particularly from Colorado Interstate Gas Company, the 18½ cent price will not trigger any other gas purchase contracts of El Paso, the contract price in itself will not cause an increase in El Paso's rates, and the higher price is necessary to stimulate exploration and development.

Attention is called to the applicants' contention that these prices will not trigger the price of gas in any of El Paso's gas purchase contracts under so-called favored nation provisions. In these proceedings, El Paso's contract with Beneficial and Belco does include acreage in the East LaBarge Unit, which unit lies adjacent to the Green River Bend Unit and the Figure Four Canyon Unit. These units are within the same gas field and the production therefrom is from a common formation known as the Frontier Sand. As noted in the decision granting certificates of public convenience and necessity to Humble, Pan American, and Belco to sell gas to El Paso from the East LaBarge Unit, the contract between El Paso and Pan American therein referred to does contain a favored nation clause, operative as to the East LaBarge Unit.[5] (24 FPC 198.)

The above contentions have been heretofore advanced by these same applicants in the above-mentioned East LaBarge case, involving the sale of gas to El Paso from the same area. The Commission held in that proceeding that the applicants El Paso, Humble, Pan American, and Belco had not justified the contract price and conditioned such price to 15 cents per Mcf at 14.65 psia. With the exception of additional evidence being introduced in support of the claim that higher

[5] Pan American FPC Rate Schedule 236. Notwithstanding the foregoing provisions of this Article VII, the price to be paid by Buyer to Seller hereunder shall be at least equal to the highest price then being paid or contracted to be paid by Buyer or any other company while such other company is a subsidiary, parent, or affiliate of Buyer for gas from the East LaBarge Unit, adjusted for differences in quality and delivery conditions and all other pertinent factors.

prices are necessary to stimulate exploration and development, the evidence offered by the applicants as to the above contentions in justification of the price in these proceedings is the same as that adduced in the East LaBarge case through the same witnesses, and the applicants here are merely rearguing the same evidence. The conclusions thereon as set forth in the East LaBarge decision are also applicable to the evidence in these proceedings, and by this reference are incorporated herein.

As to the additional evidence in support of the claim of higher prices needed for an incentive to explore and develop natural gas, Humble refers to its refusal to accept a farm-out proposal from the Mountain Fuel Supply Company in the Green River Basin area, which was to be coupled with an agreement that if Humble found gas it would sell the same to Mountain Fuel at a price of 15 cents per Mcf. Humble's position is that the 15 cents per Mcf price was insufficient to justify it in committing funds to the proposal. It takes the position that it is not concerned with the cost of producing gas, but rather with the market price in this area as compared with other areas in the face of its position that El Paso need not maintain a uniform price to all producers along its system. It is argued that the Mountain Fuel contracts resulting from farm-out agreements cannot be used as a basis for comparison because "they are not predicated on the competitive nature of the industry and do not result from arm's length negotiations." The farm-out arrangements are accepted practice in the industry and, as disclosed in these proceedings, are entered into by these applicants. Further, the record herein does not disclose that such arrangements are entered into with Mountain Fuel on other than the free choice of the contracting parties. The fact that a party refuses to pay as much for gas as Humble demands is evidence of arm's length bargaining.

It is argued that Pan American decided that it was not economically attractive to continue developing the properties for deep Frontier gas if it was not permitted to receive its contracts price for the gas. Thus, it negotiated the trade with Belco whereby Pan American acquired interest in the oil producing properties for its deep gas producing rights in the area subject to these proceedings. The short answer to this argument is that Belco was willing and did make the trade for the gas rights held by Pan American.

The main thrust of applicants' claim for the contract price as being necessary to stimulate exploration and development of gas by them in this area rests upon the testimony given and an exhibit of trends introduced through a consulting economist. It is contended through this witness that the contract price here in question may be tested as to its reasonableness by reference to the industry's financial requirements. To establish these requirements, reliance is placed upon certain supply, demand, cost, revenue, and market price trends. These trends are derived from selected data from the Census of Mineral Industries, United States Bureau of Mines, Mineral Year Book, and trade publications, grouped principally in the following four categories: (1) the entire United States; (2) the States of Colorado, Montana, Utah, and Wyoming; (3) the States of Kansas, New Mexico, Oklahoma, and Texas; and (4) a combination of the foregoing eight States.

From these trends, the witness contends that there is a need for gas prices to rise steadily until the various trends, such as decline in productivity per foot drilled, increase in cost of production, and decline in ratio of new supply to net production have been reversed. These trends will be reversed, he observes, when prices rise high enough to bring forth the supplies needed to equal demand. Thus, it is claimed that the contract price here fixed by the bargaining process is reasonable as a decline is shown, according to these trends, occurring in new supplies in relation to the demand. The witness takes the position

that the only meaningful and relevant costs are the total industry costs and it is not possible to relate these producers' financial requirements to either area prices or specific supply prices except through the mechanics of the competitive market system, which basically is supply and demand, and at the same time maintains that the incentive is merely in terms of managerial estimates of whether or not they can break even and make a profit from particular commitments of capital. The latter is also in line with the producers' argument that the proposed price in these certificate proceedings should be left standing and found to be in line if it is within the pattern of prices which do not yield an excessive profit level, or which have not risen more rapidly than cost, and that the profit must be commensurate with the financial hazards involved. The difficulty in these proceedings is that the record does not disclose the cost necessary to make such determinations or what profits the applicants will or expect to receive from the sale of the gas to El Paso.

The foreging trends admittedly do not include significant categories of cost, and include costs associated with the production of total hydrocarbons. Also, the market price trends include prices which are subject to both Commission and court review, contrary to the holding in *United Gas Improvement Company* v. *Federal Power Commission*, 283 F. 2d 817 (CA9), and *Public Service Commission of New York* v. *Federal Power Commission*, 287 F. 2d 146 (CADC). This witness was unaware that producers engaged in supplying different types of material from their leases do estimate the cost of each product for the purpose of measuring the relative profitability of various operations and as a general yardstick for resting the adequacy of sales prices.*

The allocation of joint costs is a common accounting practice, as pointed out by the Commission in *Northwestern Electric Company*, 2 FPC 327, 335–6:

> * * * Under the systems of accounts generally in effect in the past for electric utilities, and also under the present system, utility officials have been and are permitted considerable discretion in accounting for certain joint and other costs which cannot clearly be classified as plant costs or operating expenses. This is particularly true as to those items which are subject to proration or allocation. * * *

---

*E. E. Hunter, of Humble Oil & Refining Co., Houston, Texas, in a Feature Article, Journal of Petroleum Technology, July 1954, pointed out that oil producing companies should change their method of accounting for gas under present day conditions, stating in part:

Petroleum producers have been engaged for many years in supplying several different types of materials from the leases they operate. Some leases produce crude oil and casinghead gas, others produce gas-well gas and condensate, and still others produce all four of these materials. Therefore, the problem of allocating costs between these intermingled products is not a new one.

* * * * *

This problem of allocating common costs is not peculiar to the petroleum producing industry. For example, the meat packing, milling, chemical, lumber, and petroleum refining industries are all faced with the problem of allocating common costs between two or more joint products. The difficulty or impossibility, of allocating such costs 'exactly' by no means lessens the need for some careful estimates of the cost of each product for the purpose of measuring the relative profitability of various operations and as a general yardstick for testing the adequacy of sales prices. Each industry has developed cost accounting procedures that are logical under the prevailing operating circumstances. As conditions change, the accounting procedures change with them. There is no reason why petroleum producers cannot change their traditional custom of considering that all costs are applicable to crude oil, just as other industries have changed their customs when necessary.

The discussion that follows will be devoted principally to the method of allocating producing cost that has been adopted by Humble Oil & Refining Co.***

> The company claims that the cost of public utility plant is a fact not at all dependent upon any accounting practices. We know that the cost of any utility plant is the resultant of the allowable accounting discretion of the utility as exercised within the limit permitted by the system of accounts, but the utility having exercised such allowable discretion is thereafter bound by the cost resulting therefrom. Many expenditures made by a utility must be assigned, allocated, or prorated on the basis of judgment, to the various plant and operating accounts. The cost of plant is dependent upon those assignments, allocations, and prorations, just as operating expenses are dependent thereon.

While the Commission has pointed out that the justification of prices in certificate proceedings need not entail the showing required in rate cases, this does not mean that such justification can be made on evidence unacceptable in rate cases. As late as June 1, 1961, the Commission, in *Alfred C. Glassell, Jr., et al.*, Docket No. G-9278, a producer rate proceeding under Section 5 of the Natural Gas Act, stated:

> In determining the rate base of natural gas companies in the administration of the Natural Gas Act, we have consistently refused to give weight to evidence of reproduction cost, price trends or current market value. These determinations have so frequently been made and upheld by the courts that we believe it unnecessary to review again the underlying considerations for this administrative judgment. [25 FPC 1071 at 1073]

In *United Gas Improvement Co.* v. *F.P.C.*, 290 F. 2d 147, 148 (CA5), the Court, in passing upon the granting of a certificate of public convenience and necessity under Section 7 of the Natural Gas Act, stated:

> As we have pointed out in the companion case No. 18,112, the record makes it clear that the finding of public convenience and necessity here is based too strongly on the fact that arm's length dealing and the effect of supply and demand required Transco to agree to the disputed price, rather than that the price had any relation to what might ultimately be found to be a just and reasonable price.

The evidence does not support the proposed price of 18½ cents per Mcf as necessary to the present or future public convenience and ncessity, and, if allowed, the unsupported price will be another inflationary step adversely influencing the cost of gas delivered off the El Paso system. As heretofore pointed out, the present going firm price for gas produced in this area is 15 cents per Mcf at a pressure base of 14.65 psia, and the certificates to be issued should be conditioned to reflect this price.

The argument advanced by the State of California that the indefinite escalation clauses set forth in the contracts which were executed prior to April 3, 1961, should be held inoperative has already been considered by the Commission at the time it adopted Order No. 232A, on March 31, 1961, and no justification for the attaching of such a condition has been shown in this record. Southern California contends that the one cent per Mcf five-year periodical escalations in price should be related to the conditioned price of 15 cents rather than to the 18½ cent contract price. The determination of the rate level for sales of gas to be made in the future can be more properly made under the circumstances existing at the time of the filing for the increase, and should not be passed upon at this time.

ADDITIONAL FINDINGS AND CONCLUSIONS

Upon consideration of the record in these proceedings, it is found and concluded, in addition to the findings and conclusions heretofore stated, that:

(1) El Paso is a natural-gas company within the meaning of the Natural Gas Act, and its facilities for which a certificate is requested will constitute an integral part of El Paso's transmission system and will be used to transport natural gas moving in interstate commerce for resale to ultimate consumers. The construction and operation of such facilities are subject to requirements of subsections (c) and (e) of Section 7 of the Natural Gas Act.

(2) El Paso is a qualified applicant and is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(3) The above-referred to facilities and the operation thereof, including the sale of natural gas, are required by the public convenience and necessity and a certificate authorizing the same should be issued on the terms and conditions of this order, which terms and conditions are reasonable and required by the public convenience and necessity.

(4) Humble, Belco, and Beneficial are now, or will become upon the commencement of the sale of natural gas as proposed in these proceedings, natural-gas companies within the meaning of the Natural Gas Act as independent producers of natural gas as defined in the Commission's regulations, and the sales of natural gas for which certificates are requested will be made in interstate commerce for resale for ultimate public consumption, and such sales, together with the construction and operation of facilities subject to the jurisdiction of the Commission necessary therefor, are subject to the requirements of subsections (c) and (e) of Section 7 of the Natural Gas Act.

(5) Humble, Belco, and Beneficial are qualified applicants and, subject to the requirements of this order and the conditions of the certificates issued to them, are able and willing properly to do the acts and to perform the service proposed, and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(6) The sale as proposed of natural gas by Humble, Belco and Beneficial to El Paso, together with the construction and operation of any facilities subject to the jurisdiction of the Commission necessary therefor, are required by the public convenience and necessity, if made at a rate not in excess of 15 cents per Mcf at a pressure of 14.65 psia, and certificates authorizing the same should issue to each of them upon the terms and conditions of this order, which terms and conditions are reasonable and required by the public convenience and necessity.

(7) The application of Pan American should be dismissed, and the temporary certificate issued pursuant thereto should be rescinded.

(8) The additional conditions to the certificates, as requested, are not required by the public convenience and necessity and should be denied.

ORDER

WHEREFORE, IT IS ORDERED, subject to review by the Commission, that:

(A) A certificate of public convenience and necessity hereby is issued to El Paso for the construction and operation of the facilities referred to above, all as more fully described in its application in these proceedings, for the transportation and sale of natural gas in interstate commerce subject to and upon the terms and conditions of this order.

(B) Certificates of public convenience and necessity hereby are issued to Humble, Belco, and Beneficial for the sale as proposed of natural gas in interstate commerce for resale, together with the construction and operation of any facilities subject to the jurisdiction of the Commission necessary therefor, upon the terms and conditions of this order.

(C) As conditions to the authorization herein granted, Humble, Belco, and Beneficial, the initial price for the sale of gas as proposed to El Paso shall be 15 cents per Mcf at a pressure of 14.65 psia in substitution for the initial price provided for in the contracts and the producers shall file supplements to their filed rate schedules reflecting the 15 cent price.

(D) The certificates herein issued shall be accepted in writing, under oath, within 30 days from the date of issuance of this order.

(E) The certificates issued herein are not transferable and shall be effective only so long as each of the applicants continues the acts and operations herein authorized in accordance with the provisions of the Natural Gas Act and the applicable rules, regulations, and orders of the Commission.

(F) The grant of the certificates herein shall not be construed as a waiver of the requirements of Section 4 of the Natural Gas Act or Part 154 of the Commission's regulations thereunder, requiring the filing of rate schedules for the service herein authorized, and is without prejudice to any findings or orders which have been or hereafter may be made by the Commission in any proceeding now pending or hereafter instituted by or against the applicants.

(G) The application for a certificate of public convenience and necessity by Pan American hereby is denied, and the temporary authorization issued thereunder is rescinded.

(H) The conditions to the certificates here issued, as requested by the State of California and Southern California pertaining to the price provisions for the sale of gas, other than as imposed herein, are denied.

ALVIN A. KURTZ,
Presiding Examiner.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

VILLAGE OF LOUISVILLE, ILLINOIS, DOCKET NO. CP61-346

ORDER TERMINATING PROCEEDING

(Issued June 11, 1962)

On June 30, 1961, the Village of Louisville, Illinois (Applicant), Clay County, Illinois filed an application for an order pursuant to Section 7(a) of the Natural Gas Act directing Trunkline Gas Company to establish physical connection of its transmission facilities with the facilities proposed to be contructed by Applicant and to sell and deliver to Applicant up to 506 Mcf per day. Notice of this application was issued on November 6, 1961 (26 FR 10709).

Applicant has previously intervened in the consolidated proceeding, *American Louisiana Pipe Line Co., et al.*, Docket No. 2306, *et al.*, seeking a similar order against Trunkline. By our order issued May 17, 1962, 27 FPC 967, affirming the decision of the presiding examiner, Trunkline was ordered to establish physical connection of its transportation facilities with Applicant's proposed facilities and to sell up to the required quantity of natural gas. The instant proceeding has thereby been rendered moot. No further purpose would be served by the continuance of this proceeding and the proceeding herein should be terminated.

The Commission orders:

The proceeding in Docket No. CP61–346 is hereby terminated.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., and Harold C. Woodward.

REVISION OF ANNUAL REPORT FORM PRESCRIBED FOR CLASS C AND CLASS D PUBLIC UTILITIES AND LICENSEES SUBJECT TO THE FEDERAL POWER ACT, F.P.C. FORM NO. 1–F, DOCKET NO. R–213

ORDER NO. 250

ORDER PROMULGATING A REVISED ANNUAL REPORT FORM FOR CLASS C AND CLASS D PUBLIC UTILITIES AND LICENSEES

(Issued June 11, 1962)*

The Commission has under consideration in this proceeding the revision of its F.P.C. Form No. 1–F, Annual Report Form Prescribed for Class C and Class D Public Utilities and Licensees Subject to the Provisions of the Federal Power Act and § 141.2, Part 141, Subchapter D—Approved Forms, Federal Power Act, Chapter I, Title 18, Code of Federal Regulations (CFR), prescribing F.P.C. Form No. 1–F. That form, as revised, is prescribed hereinafter effective for use in reporting for the calendar year beginning January 1, 1961 or subsequently during the calendar year 1961 if an established fiscal year is other than the calendar year, and years thereafter.

The various schedules comprising F.P.C. Form No. 1–F now prescribed in § 141.2 (18 CFR 141.2) correspond to, and appear as pages 1–6 of the Commission's F.P.C. Form No. 1–F, Public Utilities and Licensees, Class C and Class D.[1]

This proceeding was commenced by notice of proposed rule making served upon interested parties, including State and Federal regulator agencies, and by publication in the Federal Register on April 4, 1962 (27 F.R. 3206). As proposed, the subject matters and revisions in § 141.2, and the General Instructions and other Schedules comprising F.P.C. Form 1–F were set forth in the notice of proposed rule making and attached forms of proposed revised Schedules served upon the aforesaid interested parties and filed as a part of the notice submitted to the Federal Register for publication. The notice of proposed rule making invited the submission to the Commission of written data, views, comments and suggestions concerning the proposed revisions of F.P.C. Form

* Published in the Federal Register on June 15, 1962, (27 F.R. 5706).

[1] For reporting years 1939 through 1958 this Commission had separate annual report forms for Class C and Class D electric utilities and licensees. The report form for Class C companies was prescribed by Order No. 55 of September 7, 1938 (3 F.R. 2254, September 20, 1938) and amended by Order No. 76 of September 24, 1940 (5 F.R. 3860, October 1, 1940), Order No. 110 of December 21, 1943 (8 F.R. 17337, December 28, 1943), and Order No. 150 of November 22, 1949 (14 F.R. 7248, December 2, 1949). The report form for Class D companies was prescribed by Order No. 56 of September 7, 1938 (3 F.R. 2255, September 20, 1938), and amended by Order No. 77 of September 24, 1940 (5 F.R. 3860, October 1, 1940), Order No. 111 of December 21, 1943 (8 F.R. 17337, December 28, 1943), and by Order No. 150 of November 22, 1949 (14 F.R. 7248, December 2, 1949).

The combined report form, for Class C and Class D companies, F.P.C. Form No. 1–F was promulgated by Order No. 212 of March 26, 1959 (24 F.R. 2526, April 1, 1959) (21 FPC 387).

No. 1–F and Part 141 on or before April 20, 1962. No filing responsive to the notice of proposed rule making has been received.

The exact nature of each of the revisions in Form 1–F is fully set forth in the respective accompanying schedule pages. The changes would be accomplished mainly through modification of existing schedules. One new schedule, Transmission Lines Added During the Year, has been added. The revised Annual Report Forms has been adapted to changes prescribed in the Uniform System of Accounts, Prescribed for Public Utilities and Licensees effective January 1, 1961.

The Commission finds:

(1) The notice and opportunity to comment in this rule making proceeding with respect to the matters presently before the Commission in the manner as described above are consistent and in accordance with the procedural requirements of Section 4 of the Administrative Procedure Act.

(2) In view of the foregoing, and upon consideration of all relevant matters presented it is necessary and appropriate for the purposes of the Federal Power Act that:

(a) The revised Annual Report Form as set forth in annexed Appendix A be adopted and promulgated as this Commission's F.P.C. Form No. 1–F effective for use in reporting for the calendar year beginning January 1, 1961 or subsequently during the calendar year if an established fiscal year is other than the calendar year, and years thereafter; all as hereinafter provided.

(b) Section 141.2, Part 141, Subchapter D—Approved Forms Federal Power Act, Chapter I, Title 18, Code of Federal Regulations be amended to read as hereinafter provided.

(3) Good cause exists for adoption and promulgation of the matters referred to above immediately upon issuance of this order; all as hereinafter provided.

The Commission acting pursuant to the Federal Power Act, as amended particularly Sections 3(13), 4 (a), (b), (c), 301 (a), 302, 304, 309 and 311 thereof (16 U.S.C. 796 (13), 797 (a), (b), (c), 825 (a), 825a, 825c, 825h, and 826j *orders:*

(A) The revised Report Form as set forth in annexed Appendix A is adopted and promulgated as this Commission's F.P.C. Form No. 1–F effective for use in reporting for the calendar year beginning January 1, 1961, or subsequently during the calendar year 1961 if an established fiscal year is other than the calendar year, and years thereafter.

(B) Section 141.2, Part 141, Subchapter D—Approved Forms, Federal Power Act, of Chapter I of Title 18 of the Code of Federal Regulations, is amended to read as follows:

§ 141.2 *Form No. 1–F; Annual Report for public utilities and licensees, (Class C and Class D)*

(a) The form of Annual Report for public utilities and licensees, Class C and Class D, designated as F.P.C. Form 1–F in the Commission's Regulations under the Federal Power Act is prescribed for the year 1961 and thereafter.

This report form is not prescribed for municipalities as defined in Section 3 of the Federal Power Act; i.e., a city, county, irrigation district, drainage district, or other political subdivision or agency of a State competent under the laws thereof to carry on the business of developing, transmitting, utilizing, or distributing power.

(b) Each public utility or licensee, as defined in the Federal Power Act which is included in Class C or Class D as defined in the Commission's Uniform System of Accounts Prescribed for Public Utilities and Licensees, effective January 1,

1961, shall prepare and file with the Commission for the year beginning January 1, 1961 or subsequently during the calendar year 1961 if its established fiscal year is other than the calendar year, and for each year thereafter, on or before the last day of the third month following the close of the calendar year or other established fiscal year (except that such reports for the calendar year 1961 or a fiscal year beginning during 1961 may be filed on or before July 16, 1962 or one month after the end of the fiscal year whichever is later) an original and one conformed copy of the above-designated F.P.C. Form 1–F, all properly filled out and verified. One copy of said report should be retained by the correspondent in its files. The conformed copy may be a carbon copy if legible.

(c) This annual report contains the following schedules:

Identification
General Instructions
General Information
Security Holders and Voting Powers
Officers and Directors
Comparative Balance Sheet
Accumulated Provision for Depreciation and Amortization of Utility Plant
Capital Stock
Long-Term Debt
Condensed Income Statement
Earned Surplus
Electric Sales Data for the Year
Sales of Electricity for Resale
Electric Operation and Maintenance Expenses
Purchased Power
Utility Plant
Generating Station Statistics
Transmission Line Statistics
Transmission Lines Added During Year
Verification

[Authority: Sections 3(13), 4 (a), (b), (c), 41 Stat. 1065, as amended, Sections 301 (a), 302, 304, 309, 311, 49 Stat. 838, 839, 854, 855, 858, 859; 16 U.S.C. 796 (13), 797 (a), (b), (c), 825 (a), 825a, 825c, 825h, 825j.]

(C) This order shall be effective upon the date of issuance thereof.

(D) The Secretary of the Commission shall cause prompt publication of this order to be made in the Federal Register.

STANDARD OIL COMPANY OF CALIFORNIA, DOCKET NO. CI60–333; DORSEY BUTTRAM, CI60–442; GEORGE P. CAULKINS, JR., CI60–560; GULF OIL CORPORATION, CI60–636

OPINION AND ORDER ISSUING CERTIFICATES OF PUBLIC CONVENIENCE AND NECESSITY

(Issued June 11, 1962)*

Syllabus

1. Existing Utah sales cannot be relied upon in determining price level for Red Wash sales here; Uintah Basin sales do not represent sufficient quantities or enough contracts to constitute established and stable market; other

* Designated Commission opinion No. 359. Initial decision appears on page 1162. Modified and affirmed; rehearing denied by order issued August 6, 1962, 28 FPC 292. Affirmed, 315 F. 2d 652 (CA 10–1963).

sales, while in sizable quantities, are in a wholly unrelated geological producing and marketing area. P. 1157.

2. Price line for sales in neighboring Wyoming may appropriately be applied to Red Wash sales since this producing region with respect to geology, geography, producing and marketing, is quite similar to Uintah Basin. P. 1157.
3. *Distinguishing Panhandle* case, Commission *rejects* producer contention that in line price should apply to gas at the wellhead. P. 1158; 1159.
4. Referring to *Opinion 358* Commission *concludes* 15.384 cent price there authorized should apply to Red Wash sales. P. 1158; 1160.
5. Additional allowance for gathering, compressing, etc. is not applicable in other areas where gas is traditionally sold at tailgate of plant; in line price in each area is determined at customary delivery point in that area. P. 1159.
6. Producers' take-or-pay provisions allowed, subject to ultimate disposition in Docket No. R–199. P. 1160.
7. Commission *issues* certificates of public convenience and necessity under Section 7 of the Natural Gas Act. P. 1161.

Justin R. Wolf, Eugene Threadgill, and V. P. Cline for Standard Oil Company of California.

Barth P. Walker for Dorsey Buttram.

William M. Bennett, William L. Cole, and *J. Calvin Simpson* for the People of the State of California, and Public Utilities Commission of the State of California.

F. T. Searls and *Malcolm H. Furbush* for Pacific Gas & Electric Company.

Allen R. Grambling and *George D. Horning, Jr.* for El Paso Natural Gas Company.

John Paul Geneau for Staff of the Federal Power Commission.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

Ross, *Commissioner:*

This proceeding arises under Section 7 of the Natural Gas Act (Act). The applicants are independent producers of natural gas. They seek certificates of public convenience and necessity for the sale of natural gas from the Red Wash field, Uintah County, Utah, to El Paso Natural Gas Company (El Paso).

The Red Wash field is a unitized operation in which all of the producer applicants have participating interests. Standard Oil Company of California (Standard) is the operator of the unit and majority interest holder, having a 97.64 percent interest.[1] The interest holdings of the other applicants are as follows: Gulf Oil Corporation 1.18 percent, Dorsey Buttram 0.885 percent, and George P. Caulkins, Jr. 0.295 percent.

---

[1] Effective January 1, 1961, Standard's interest in the properties here involved were transferred to the California Oil Company, Western Division, a wholly owned subsidiary. Appropriate filings have been made with the Commission to effect this succession of interest. Accordingly, all references to Standard herein, and the certificate herein issued to Standard, shall extend to the California Oil Company, Western Division, as successor in interest to Standard.

The Red Wash field contains both casinghead gas and dry gas. Since the discovery oil well was drilled in 1951, the field has been developed to include 123 producing oil wells and 6 gas wells. The gas wells have not as yet been produced, and until 1960, when the applicants received temporary authorization to sell the Red Wash gas to El Paso the field was operated solely for the production of oil and the recovery of liquids from the casinghead wells, the residue gas being compressed and reinjected to aid in the production of oil.

The applicants propose to sell and, in accordance with the temporary authorization granted, are now selling gas to El Paso at the tailgate of their Red Wash extraction plant. The gas is gathered, processed for the removal of liquid hydrocarbons, compressed and dehydrated by the applicants, and is delivered into El Paso's lateral at 900 pounds pressure with a Btu content of 1,055 Btu's per cubic foot.[2] As required by the Commission's temporary authorization, the gas is presently being sold at a conditioned price of 15 cents per Mcf at 15.025 psia.

The main issue in this proceeding is the initial price to be charged for the Red Wash gas. Under their contracts with El Paso, the applicants have agreed to sell and deliver to the pipeline a minimum of 82,125,000 Mcf of gas[3] over a 20-year period, at an initial price of 18.5 cents per Mcf. The contracts provide for periodic increases of 1.0 cents per Mcf every five years, or such greater amounts as the parties may negotiate on the basis of a fair market price.[4] The contracts further provide for reimbursement to the applicants of 75 percent of all future taxes. The applicants are required to deliver, and El Paso is required to take-or-pay for an average of 11,250 Mcf per day on an annual basis, or approximately 4,100,000 Mcf per year. On a daily basis, El Paso is required to take and pay for a minimum of 7,500 Mcf, and may take up to 15,000 Mcf per day. The applicants, however, are not required to deliver more than an average of 11,250 Mcf per day on an annual basis.[5] If, in any year, El Paso is required to pay for gas which it does not take, the contracts provide that El Paso may take the gas so paid for over a period of five years, or over the remaining term of the contract, if less than five years. If El Paso has not taken all of the gas for which it has paid by the time the contracts expire, it may take such gas during the following year up to the maximum daily delivery obligation of the applicants immediately prior to the termination of the contracts. The contracts provide no upward adjustment in price based on the Btu content of the gas. The contracts, however, do require a minimum heating value of 985 Btu's per cubic foot, and provide that if El Paso wishes to take delivery of gas containing less than 985 Btu's per cubic foot, it may do so at

[2] By order issued February 2, 1960, in Docket No. G-20051, El Paso was authorized to construct and operate 8.9 miles of lateral connecting its main transmissin line with the Red Wash plant. The cost of this was $412,412. (23 FPC 287).

[3] Recoverable reserves in the Red Wash field are estimated at 182,000,000 Mcf. The applicants, upon notice, may increase the contract quantities to El Paso.

[4] Under Section 154.93 of the Commission's Regulations under the Natural Gas Act, as amended effective April 13, 1961, and April 2, 1962, this renegotiation provision would be inoperative and of no effect as part of applicants' rate schedules if their contracts were executed on or after April 3, 1961, and the contracts themselves would be rejected as rate schedules if the contracts with this provision were executed on or after April 2, 1962. Inasmuch as the contracts in this case were executed prior to April 3, 1961, the renegotiation provision is here allowed, although contrary to present Commission policy; and its allowance is not to be construed as a waiver or exception to that policy.

[5] If, as referred to in footnote 3 above, the applicants make additional quantities of gas available to El Paso, El Paso is required to take and pay for 50 percent of the daily availability on a daily basis, and to take-or-pay for 75 percent of the daily availability on an annual basis. The applicants are not required to deliver more than 75 percent of the daily availability on an annual basis.

a price reduced proportionally to the reduction in heating value below the minimum required.

On September 28, 1961, the examiner who presided at the hearing in this proceeding, issued an initial decision recommending that certificates of public convenience and necessity be issued to the applicants as proposed, subject, however, to the condition that the initial price shall be 15 cents per Mcf at 15.025 psia in substitution for the 18.5-cent initial contract price proposed, and that the applicants' filed rate schedules be supplemented to reflect the 15-cent price. Exceptions to the examiner's decision were subsequently filed by each of the applicants, by the People of the State of California and the Public Utilities Commission of the State of California (interveners in this proceeding, and jointly referred to as California),[6] and by staff.

At the time the examiner issued his decision, the Commission had not established any ceiling price level for initial service in the State of Utah. The Commission's *Statement of General Policy No. 61–1*, issued September 28, 1960, 24 FPC 818, under which the Commission inaugurated a policy of area pricing, prescribed a ceiling level for initial service rates of 15 cents per Mcf at 15.025 psia in neighboring Colorado, and 15 cents per Mcf at 14.65 psia (15.384 cents at 15.025 psia) in neighboring Wyoming, but was silent with respect to Utah. In the absence of a policy determination by the Commission as to the in-line price to be used as a guide in certificating sales in Utah, the examiner, upon an analysis of certificated sales in Utah, Colorado, and Wyoming, concluded that the appropriate pricing area for determining a proper initial price for gas sold from the Red Wash field, which is located in the northeastern corner of Utah, is northeastern Utah, northwestern Colorado, and southwestern Wyoming. In the pricing area thus determined, the examiner concluded that the in-line price governing the Red Wash sale is 15 cents at 15.025 psia, the price prescribed by the temporary certificates issued to the applicants.

The applicants take exception to the examiner's determination of the proper pricing area, which excludes the Paradox Basin in southeastern Utah where the Commission has certificated sales to El Paso from the Aneth field at 17.7 cents per Mcf. The applicants further except to the examiner's 15-cent price condition as ignoring the need for incentive to carry on exploration and development in the Uintah Basin, and as failing to make any allowance for the fact that the Red Wash gas is gathered, dehydrated and compressed by the applicants before delivery to El Paso. They also contend that the 15-cent price condition is erroneously based on a 15.025 pressure base, and that if a 15-cent price condition is to be imposed, it should be 15 cents at 14.65 psia, which is the equivalent of 15.384 cents at 15.025 psia. California takes exception to the examiner's failure to require the applicants to produce cost evidence in support of their proposed initial price, and in the absence of such cost evidence urges that the certificates be denied, or the proceeding reopened for the taking of such evidence. California also excepts to the issuance of certificates to the applicants on the ground that they have failed to show El Paso's need for the Red Wash gas.[7] Staff's exceptions contend that the examiner erred in considering sales outside

[6] Other interveners in this proceeding are: Southern California Gas Company and Southern Counties Gas Company of California (jointly referred to as the Southern California Companies), Pacific Gas and Electric Company (P.G.&E.), and El Paso.

[7] California did not raise the question of need at the hearing, but first raised it in its brief after the hearing had concluded. The examiner found that El Paso's need for gas is a well established fact publicly declared by the Commission in recent proceedings (citing cases); and that if California had any evidence or basis for contending otherwise, the matter properly should have been advanced at the hearing, where the other parties would have an opportunity to present evidence confirming El Paso's need for the gas.

of the State of Utah in determining the proper initial price to be allowed the applicants in this proceeding, and that a comparison of the proposed sales with other sales in Utah justifies an initial price of no more than 12 cents per Mcf. Staff also questions the propriety of the examiner's consideration of the question of El Paso's need for gas, since that question is not properly an issue in this proceeding, having already been disposed of in the certificate proceeding in Docket No. G–20051, wherein El Paso was authorized to construct and operate the facilities required to take delivery of the Red Wash gas.

The Red Wash field is located in an area of northeastern Utah known geologically as the Uintah Basin. This area, and the Paradox Basin in the southeastern corner of the state, are the only areas in Utah from which natural gas is presently being produced and sold in interstate commerce. The first sale of gas in Utah certificated by the Commission was from the Bar–X field in the Uintah Basin in 1957. Since then the Commission has certificated sales from the Westwater field, also in the Uintah Basin, and from the Aneth field in the Paradox Basin. The gas in each case is sold to El Paso—the Aneth gas for delivery to markets in southern California, and the Bar–X and Westwater gas for delivery to markets in the Pacific Northwest. Like the other gas from the Uintah Basin, the Red Wash gas is being taken into El Paso's Pacific transmission line near the Utah-Colorado border for delivery to the Pacific Northwest.

The record shows that the Bar–X sales are wellhead sales at 12 cents per Mcf for gas delivered at 500 psig and containing 1000 Btu's per cubic foot. Staff estimates these sales to cover 2,331,000 Mcf annually. The Westwater sales are also based on a wellhead price of 12 cents, and involve gas delivered at 900 psig with a Btu content of 900–985; but the Westwater gas is gathered and transported to El Paso's main line through a lateral constructed by the producers, for which service El Paso pays an additional charge of 5.5 cents per Mcf. The Westwater sales are estimated at 3,240,000 Mcf annually, but are expected to decline to less than one million within three to six years. In the Aneth field in the Paradox Basin, El Paso is purchasing an estimated 34,000,000 Mcf annually at 17.7 cents per Mcf, delivered at 850 psig with a Btu content of 950 at a central point in the field.

In our opinion, these existing Utah sales cannot be relied upon in determining a price line for the Red Wash sales here proposed. The Bar–X and Westwater sales do not represent sufficient quantities of gas, or enough contracts, to constitute an established and stable market for gas in the Uintah Basin. The Aneth sales, although of sizeable quantities, are in a geological producing area and a marketing area wholly unrelated to the Red Wash sales, and cannot be found to be part of the same pricing area as the Uintah Basin. It is necessary, therefore, to look beyond the boundaries of Utah to sales in the adjoining states of Colorado and Wyoming to find comparable sales which may be used as a basis for determining the price line applicable to the Red Wash sales.

As noted above, the Commission has established a ceiling price for Wyoming of 15 cents per Mcf at 14.65 psia, which is the equivalent of 15.384 cents at a 15.025 pressure base. The Colorado ceiling is 15 cents per Mcf at 15.025 psia. The record shows substantial sales of gas in Sublette, Lincoln, and Sweetwater Counties in southwestern Wyoming at the ceiling level of 15.384 cents. This 15.384-cent gas is gas well gas of pipeline quality, delivered at pressures up to 860 psig at the wellhead. It is produced in a region which, with respect to geology, geography, and the conditions of exploration, production and marketing, is quite similar to the Uintah Basin of northeastern Utah. We have found that in the absence of compelling evidence to justify some higher price, the public convenience and necessity requires the sale of this Wyoming gas at a price no

higher than 15.384 cents.[8] In our opinion, this price line for sales in the neighboring Wyoming area may appropriately be applied to the proposed Red Wash sales in the Uintah Basin. A review of sales in the adjoining Colorado counties, as found by the examiner, does not require any different conclusion.

Statement of General Policy No. 61–1 makes it clear that the price levels established by the Commission as area ceilings apply to pipeline quality gas as that term is generally understood in each area. There is no evidence in the present proceeding to show that the Red Wash gas as delivered to El Paso is not of a quality consistent with what is generally understood in this area to be pipeline quality gas. On this basis it would appear that the 15.384-cent price properly should be applied to the Red Wash gas as delivered to El Paso at the tailgate of the Red Wash plant.

The producers contend, however, that the in-line price applies to gas at the wellhead, and that they should be granted an allowance over and above the wellhead price line for gathering, dehydration, and compresion . It is true that in a recent case we allowed producers in another area to collect an additional allowance for such services beyond the wellhead.[9] There are basic factual differences, however, between that case, which we shall refer to as the *Panhandle* case, and this one, which clearly distinguish the two and require different results.

In the *Panhandle* case, the gas in question was gas well gas produced from a gas-condensate field; and although this gas was gathered, dehydrated, and compressed by the producers, it appeared from the record that sales of gas well gas in that area of Oklahoma normally were made at the wellhead or at the outlet of a wellhead separator without being gathered, dehydrated, or compressed by the seller.[10] Inasmuch as Panhandle would have had to render these services for itself had it purchased the gas at the wellhead, and since the gas at the wellhead was of pipeline quality as understood in that area, we found that the producers should be allowed to recover a properly allocable portion of the cost of gathering, dehydration, and compression in addition to the area ceiling price applicable to the gas at the wellhead. We further found this result to be in the public interest, since such cost associated with the sale of gas in that area would normally be borne by the pipeline purchaser and passed on to the ultimate consumer.

In the present proceeding we are dealing with a wholly different situation. The gas in this case is being produced in an area located far from the Oklahoma area under consideration in the *Panhandle* case—an area in which there do not appear to be the same clear cut and well established practices found in Oklahoma. The gas which the producers are now selling to El Paso is casinghead gas produced from an oil field. Such gas, produced in conjunction with oil, is not of merchantible quality until it is processed for the removal of liquids in an extraction or gasoline plant. Of necessity this gas must be gathered in order to be processed, and both the gathering and the processing are an essential step in the production of pipeline quality gas. It is clear, therefore, that the in-line price for gas of pipeline quality in the Red Wash field includes that allocable cost of gathering and processing the casinghead gas.

With respect to the dehydration and compression of this gas, it appears that these operations are an integral part of the processing operation which the

[8] See Opinion No. 358, *El Paso Natural Gas Co., et al.*, Docket No. CP60–72, *et al.*, issued today, *Supra*, p. 1134.

[9] *Panhandle Eastern Pipe Line Co., et al.*, Docket No. CP60–103, *et al.*, Opinion No. 350, issued January 15, 1962, 27 FPC 35.

[10] In referring to dehydration, we are speaking of dehydration through an absorption process, and not of mechanical separation of water in wellhead separators.

producers have carried on at the Red Wash plant for the past ten years, whereby dehydrated residue gas has been produced in the plant, and has been, and in part is still being, reinjected under pressure to aid in the recovery of oil. Since there is nothing to indicate that the producers are rendering any service in connection with the sale of the casinghead gas to El Paso beyond what they have found to be a necessary part of their processing operation, we are of the opinion that the in-line price includes both the dehydration and compression of the casinghead gas, and is applicable to this gas as delivered to El Paso at the tailgate of the Red Wash plant in accordance with the terms and conditions of the producers' contracts.

Thus far our discussion of the producers' request for an allowance over the in-line price for gathering, dehydration, and compression has been confined to a consideration of the casinghead gas which the producers are now selling to El Paso. Apparently, the producers intend to rely on the casinghead gas to the extent that it is available to meet El Paso's contract requirements, and do not plan to begin production of their shut-in gas wells until some future time. However, the gas well gas when produced will be gathered by the producers and delivered to El Paso at the tailgate of the Red Wash plant together with the casinghead gas. To what extent the producers will utilize the existing casinghead gathering system for this purpose is not clear, and this would introduce a question of allocation; but to the extent that the producers will incur costs with respect to the gathering of the gas well gas, which are properly allocable thereto, the costs thereof should be treated as an allowance to the producers over and above the in-line price, which in this area is based on gas well gas at the wellhead. The producers, however, have not shown when they will begin production of the gas well gas; how much of such gas will be needed from time to time to meet their delivery obligations under the contracts; or what costs they expect to incur in gathering the gas to the Red Wash plant. Under the circumstances, we can make no allowance for the gathering of the gas well gas in this proceeding.[11]

The record is equally barren with respect to the expected water content and wellhead pressure of the gas well gas. There is no evidence to show that any dehydration or compression will be required for this gas to meet the quality standards of the contracts. In the absence of such evidence, there is certainly no basis for an allowance over the in-line price for dehydration and compression; and even if dehydration and compression were required to meet the conditions of the contracts, there would still be no basis for an additional allowance unless it were shown that the gas at the wellhead was of pipeline quality and that the additional services resulted in the saving of dehydration and compression costs which otherwise would have to be incurred by the pipeline, as in the *Panhandle* case.

As we noted above, there is nothing in the record before us which convinces us that the gas as delivered to El Paso in accordance with standards negotiated by the parties is not of pipeline quality as understood by them, or others, in this area. Furthermore, a review of the contracts which the Commission has approved in connection with sales in Wyoming, Colorado and Utah, reveals no consistent pattern with respect to dehydration and compression which would indicate that pipeline buyers in the area normally buy gas undehydrated and uncompressed at the wellhead. On the contrary, the record shows a number of contracts which require the producers to dehydrate their gas to meet the quality

[11] It should be noted that such allowance to producers is not applicable in other areas where gas is traditionally sold at the tailgate of a plant. The in-line price in each area is determined at the customary point of delivery in that area.

conditions for delivery under their contracts. At the same time, there is nothing in other contracts, not requiring dehydration, which would suggest that the gas delivered without dehydration is of any lesser quality with respect to entrained water than the gas which is delivered after dehydration. As for compression, we have already noted that the Wyoming ceiling, which is the in-line price governing the present sales, is actually based on sales at the wellhead of gas at 860 psig, a pressure sufficiently high to permit delivery into the buyer's pipeline without additional compression. There is no question but that the producers in Wyoming are not permitted an allowance over the ceiling price because their gas has a wellhead pressure which eliminates the need for the buyer to compress the gas at the point of delivery,[12] and there is no justification in terms of public convenience and necessity for allowing the producers in the Red Wash field in Utah any higher price for their gas delivered at comparable pessure. There is nothing in the concept of public convenience and necessity which would compel a finding on our part that consumers of gas purchased in the Red Wash field should be required to pay in excess of 15.384 cents per Mcf for the gas as delivered to El Paso.

El Paso's obligation to take gas or pay for it under its contracts with the producers is equal to the annual obligation of the producers to deliver gas. As found by the examiner, this constitutes a 100 percent take-or-pay requirement. The Southern California Companies who intervened in this proceeding argued for the adoption of a policy which would limit take-or-pay provisions to 80 percent, and sought to have the examiner condition the certificates in this proceeding accordingly. The examiner, however, allowed the 100 percent take-or-pay provisions without condition. He noted that the question of take-or-pay provisions is currently before the Commission in a rule-making proceeding in Docket No. R–199, and concluded that standardization of such provisions can only be accomplished properly when effected by general order of the Commission applicable to all producers similarly situated. The examiner is correct in this conclusion. However, as found by us in several recent cases where producers sought certificates for sales subject to 100 percent take-or-pay provisions,[13] the public interest requires that the certificates issued herein be conditioned so as to make our allowance of the proposed take-or-pay provisions subject to our ultimate disposition with respect to such provisions in Docket No. R–199.

With respect to El Paso's need for the Red Wash gas, and the exceptions of California and the staff relating thereto, we are of the opinion that staffs position is well taken, and that the question of need is not properly an issue in this proceeding, having already been disposed of in the certificate proceeding in Docket No. G–20051, wherein El Paso was authorized to construct and operate the facilities required to take delivery of the Red Wash gas.

The Commission finds:

(1) The applicants herein are independent producers of natural gas, and are, or upon initiation of the service herein proposed will be, "natural-gas companies" within the meaning of the Natural Gas Act, and are, or will be, engaged in the sale of natural gas in interstate commerce for resale for ultimate public consumption, subject to the jurisdiction of the Commission.

(2) The sales of natural gas proposed by the applicants, as referred to above and more fully described in their applications, are subject to the jurisdiction of the Commission; and such sales, together with the construction and operation

[12] See note 8 above.

[13] See the *Panhandle* case (Opinion No. 350), *supra*. *Michigan Wisconsin Pipe Line Co., et al.*, Docket Nos. CP61–102, *et al.*, Opinion No. 353, issued March 7, 1962, 27 FPC 449.

of any facilities subject to the jurisdiction of the Commission necessary therefor, are subject to the requirements of subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Subject to the requirements of our order herein and the conditions attached to the certificates herein issued, the applicants are able and willing properly to do the acts and to perform the service proposed, and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(4) The sales proposed by the applicants, together with the construction and operation of any facilities subject to the jurisdiction of the Commission necessary therefor, are required by the public convenience and necessity upon the conditions hereinafter set forth, and certificates should be issued to each of them as ordered below.

(5) The conditions attached to the certificates herein issued are required by the public convenience and necessity.

(6) Except as herein granted, the exceptions to the examiner's decision should be denied.

The Commission orders:

(A) Certificates of public convenience and necessity are hereby issued, upon the conditions hereinafter set forth, to each of the applicants in this proceeding for the sale of natural gas in interstate commerce for resale as proposed, and for the construction and operation of any facilities subject to the jurisdiction of the Commission necessary therefor, as more fully described above and in their applications.

(B) The certificates herein issued are granted upon the express condition that the initial price for the sale of gas shall not be in excess of 15 cents per Mcf at 14.65 psia (15.384 cents per Mcf at 15.025 psia), and that the applicants shall file supplements to their presently filed rate schedules reflecting the conditioned price as their initial price in lieu of the initial price provided in their contracts.

(C) The certificates herein issued are granted upon the further express condition that the allowance of the take-or-pay provisions in the applicants' contracts is subject to our ultimate disposition with respect to such provisions in the rule-making proceeding in Docket No. R–199. Upon the establishment, by regulation or policy statement, of a general policy governing such provisions in producer contracts, the applicants shall within 30 days thereafter file amended rate schedules in conformity therewith, acceptable to the Commission.

(D) The certificates herein issued are not transferable and shall be effective only so long as each of the applicants continues the acts and operations hereby authorized in accordance with the provisions of the Natural Gas Act and the applicable rules, regulations and orders of the Commission.

(E) The grant of the certificates herein shall not be construed as a waiver of the requirements of Section 4 of the Natural Gas Act, or of Part 154 of the Regulations thereunder. Such grant is without prejudice to any findings or orders which have been or may hereafter be made by the Commission in any proceeding now pending or hereafter instituted by or against the applicants. Further, the action in this proceeding shall not foreclose nor prejudice any further proceedings or objection relating to the operation of any price or related provision in the gas purchase contracts herein involved.

(F) The certificates herein issued are without prejudice to any action the Commission may determine to be necessary or appropriate as a result of the outcome of *United States* v. *El Paso Natural Gas Company and Pacific Northwest Pipeline Corporation*, Civil No. 143–57 (D. Utah).

(G) Except as herein granted, the exceptions to the examiner's decision are hereby denied.

DECISION

UPON APPLICATIONS FOR CERTIFICATES OF PUBLIC CONVENIENCE AND NECESSITY

(Issued September 28, 1961)

WESTON, *Presiding Examiner:* The main issue in this case is the proper initial price for gas sold by the above-captioned producers to El Paso Natural Gas Company. The gas comes from the so-called "Red Wash" field in northeastern Utah. It is being delivered currently under temporary authorization granted by the Commission to Standard Oil Company of California (Stancal) on April 15, 1960. The temporary authority reduced the initial contract price, 18.5 cents per Mcf at 15.025 psia, to 15.0 cents per Mcf at the same pressure, "without prejudice to such final disposition of the application for certificates as the record may require."

There is no indication in the record as to how the Commission arrived at the 15 cent level for this Utah gas. The Commission's *Statement of General Policy No. 61–1*, 24 FPC 818, does not prescribe any price level applicable to gas from that State. However, the 15 cent level is prescribed in the *Statement* for deliveries at 15.025 psia from the neighboring State of Colorado. For the neighboring State of Wyoming, 15 cents at 14.65 psia is prescribed, which translates to 15.384 cents at 15.025 psia.

Applicants contend that the permanent certificates of public convenience and necessity should be issued at the 18.5 cent level provided by the basic contracts. Staff contends for a 12 cent level; interveners contend as follows:

Southern California Gas Company and Southern Counties Gas Company of California (Southern California distributors)—15 cents per Mcf "or less;"

State of California and its Public Utilities Commission (California Commission)—12 cents per Mcf if a price line "must necessarily exist" absent cost of service evidence;

Pacific Gas and Electric Company (Pacific Gas)—between 12 cents and 15 cents per Mcf.

General Description of Project and Contract. Red Wash is a unitized field in which Stancal has a 97.640 percent participating interest and acts as the operator; Gulf's interest is 1.180 percent; and Buttram's and Caulkins' interests are, respectively, 0.885 percent and 0.295 percent. Red Wash is located on Federal and State lands; Utah and the United States receive the usual one-eighth royalties in respect of production. The field was discovered in 1951 by Stancal, which brought in a well producing 339 barels of 32 gravity oil per day, plus about 809 Mcf per day of wet gas. The field currently produces both oil and gas. Until 1960, when the gas deliveries started to be made to El Paso under the temporary authorization, the field was operated solely for production of oil. Gas, as produced, was compressed and reinjected into the formation for the sake of maximizing oil production.

The Red Wash field now consists of 130 wells, including 7 wells used for injection of gas, 6 shut-in wells capable of producing dry gas, and two dry holes. Twenty-two miles of gas gathering and reinjection system pipeline picks up the wet gas after the oil is separated out in traps near the wellhead. The wet gas so gathered is processed and compressed at a central plant; concurrently some of the residue is being reinjected and some is being sold to El Paso under the contract basing this application.

Under the standard form 20-year contract between the producers and El Paso, the initial 18.5 cent price escalates one cent every five years, and is subject to periodic five year redeterminations based on future fair market value for the time being. The initial contract quantity to be delivered by Stancal and to be taken or paid for by El Paso is 11,250 Mcf per day, or approximately 4,100,000 Mcf per year. However, on any given day or days, El Paso has the option to take any desired amount between a floor of 7,500 Mcf per day and a ceiling of 15,000 Mcf per day.

The gas is pipeline quality, *i.e.*, dehydrated sweet gas, and is picked up by El Paso's lateral line at the tailgate of Stancal's processing plant at 960 pounds pressure. The field is sufficiently proved up so that Stancal could, and did in the contract, agree to furnish at least 82,125,000 Mcf of gas over the 20-year contract period. It is currently estimated that Red Wash contains a total of 182 million Mcf of gas; this estimate is, of course, subject to revision based on further exploration and development. When the pressure maintenance program is discontinued, additional volumes of gas will be made available to El Paso.

Geography and Geology. The Red Wash field is located in the Uintah Basin of northeastern Utah, bordered on the north by the Uintah Mountains, on the west by the Wasatch Plateau, and on the south by the Book Cliffs. In the wintertime roads to the Red Wash area, *e.g.*, U.S. 40 at 14,000 feet elevation, are sometimes blocked off by snow. There is but one town in the vicinity—the town of Vernal, Utah, population 3,655, to the northwest—"advertised as being the farthest city from a railroad in the United States" (Tr. 61). The Uintah Basin is very inaccessible, resulting in high expenses of gas and oil production operations, drilling, and maintenance.

Additionally, the geology and stratography of the Uintah Basin makes exploration and development difficult and risky. The gas-bearing sands are not found as continuous blanket deposits, but as lenticular stratographic traps, with sands which are (1) erratic, but generally low, in porosity and permeability and (2) of generally small reservoir content. Fractured shales are often encountered, and drilling often produces "crooked hole trouble" (Tr. 62). Based on geology as known to date, further drilling will be to 8,000 feet or more and will be undertaken on the likelihood of finding gas deposits rather than oil, if a strike is made at all.

Geologically, the Uintah Basin is a separate province, differing from the formations found elsewhere in Utah. Another such separate gas and oil producing province is the Paradox Basin of southwestern Utah, where, as a practical matter, exploration is based on the chance of finding oil. The stratigraphic conditions of the Uintah Basin "have very great similarities to the type of stratigraphic conditions under which production is found in the northeastern part of Colorado and the southwestern part of Wyoming" (Tr. 44), and, except for greater isolation, the geography of northwestern Utah is not dissimilar.

In general, because of geography and geology, Utah has proven through the years to be the most expensive, or one of the most expensive, onshore drilling terrains in the United States. Although hydrocarbon discoveries from exploration to date have not measured up to early expectations, the expert testimony is that the area has significant potential and should be further explored and developed. The Stancal experts also testified that a gas price in Utah somewhat higher than that prevailing in Colorado and Wyoming, and on the order of 20 cents per Mcf, would be required to induce producers to undertake the dry-hole risks involved in the development of the gas potential of the Uintah Basin.

Producers' Gas Markets. In distinction to other areas, notably "pipeline alley" of the Texas-Oklahoma Panhandle, alternative possibilities for connection of Utah gas are not extensive. The only major pipeline in the entire area is the

El Paso Pacific Northwest Division line, winding northward along the Utah-Colorado border from the San Juan Basin of New Mexico towards Wyoming and ultimately to Oregon and Washington.

The Utah Natural Gas Company, operating entirely within Utah, and a wholly-owned subsidiary of El Paso, brings gas from the Clear Creek field, 90 miles to the southwest of Red Wash, to Salt Lake City. From Exhibit No. 5, it appears that there are several good shut-in gas fields south of Red Wash, and it is said that there are plans to have Utah Natural connect this gas, for intrastate consumption, at 16.5 cents per Mcf at the wellhead (Tr. 151–152).

Colorado Interstate Gas Company, the nearest large pipeline complex, lies at least 150 miles to the east and to the north of Red Wash. See "Principal Natural Gas Pipelines of the United States," F.P.C. publication, 1960.

El Paso's situation with respect to gas supply for its Pacific Northwest Division is not one of urgent or desperate need, and, in principle, its contracting for new gas in the Uintah Basin should not be subject to the compelling upward price pressures which seem to motivate much of the *Catco* thinking. *Atlantic Refining Co.* v. *F.P.C.*, 360 U.S. U.S. 378. This conclusion is borne out by the practicalities of El Paso's negotiations for connection of the Westwater field to the south of Red Wash, discussed later in this opinion.

El Paso has run 8.9 miles of lateral line in a southerly direction from its mainline to effect the connection at the tailgate of Stancal's processing plant mentioned *supra*. This connection, authorized by approval of a "budget type" application, Docket No. G–20051, order issued February 2, 1960, 23 FPC 287, was made at a cost of $412,412. (See El Paso Natural Gas Company's report to the Commission of facilities constructed, filed March 27, 1961.) Had El Paso not made this connection and the contract now under consideration, it is difficult to see how or where Stancal could have sold the Red Wash gas for transmission to conventional consumers at any price.[1] There is certainly reason to speculate, and a permissible inference, that in the case of a market so drastically limited in outlet as the Uintah Basin, El Paso, for business reasons such as the continuation of exploration incentive, made a price to Stancal in excess of the distress price which might have been exacted.[2]

In any event, the initial overture looking towards purchase of the gas was made by El Paso's predecessor company in 1957, and bargaining began with 20 cents per Mcf asked, and 18 cents per Mcf offered. (Tr. 21.) As a result of arm's-length negotiations on price, delivery obligation, take-or-pay-for commitment, pressure, and other factors, agreement was reached on the terms digested above as of January 27, 1960, and deliveries commenced at the end of June, 1960. The record shows that the contract price, 18.5 cents per Mcf, was the fair market price for the gas. On the other hand, the record does not show that the producers are prejudiced, except in regard of profitability and consequent extra incentive to explore, by the 15 cents per Mcf price imposed by the Commission. Assuming that 15 cents per Mcf, or any price lower than the market price, is the *correct* price for the Red Wash gas, producer profit limitation

[1] Western Slope Gas Co., a wholly-owned subsidiary of Public Service Company of Colorado, is mentioned in the testimony herein, in addition to Utah Natural Gas Co. (*supra*). However, Western Slope operates entirely within Colorado and therefore is not a competitor of El Paso for out-of-state gas. See *Pacific Northwest Pipeline Corp.*, *supra*, 22 FPC at 118, 119.

[2] Stancal, protesting the 15 cent price limitation imposed by the Commission in its temporary authorization, *supra*, nonetheless connected the gas because of the "emergency situation requiring prompt commencement of deliveries from the Red Wash field." However, Stancal asked the Commission for, and was refused, an amendment of the authorization to provide for a 16 cent price. Petition to Amend Temporary Authorization, Docket No. CI60–333, filed May 16, 1960, and page 2 thereof.

resulting from the imposition of that price is simply a necessary consequence of Commission regulation in the public interest. See the governing principles of the common law, restated in *Munn* v. *Illinois*, 94 U.S. 113. The basic question remains: What are the principles on which we find the *correct* price for the Red Wash gas?

PRELIMINARY CONSIDERATIONS

In respect of the incidents of the sale of gas by producers to interstate pipelines, including the pricing of the gas, it may be said that *Phillips* [3] directed a change in the previous free economy of the open market, and contemplated a planned economy under Commission regulation. Phillips, however, did not structure (build the basis for) the operation of the planned economy in respect of producers. The structure was presumably that set forth by the Natural Gas Act. See *City of Detroit* v. *F.P.C.*, 230 F. 2d 810 (CADC), *cert.* denied 352 U.S. 829 reh. denied 352 U.S. 919. The Act, theretofore applied to "conventional" interstate gas utilities, after *Phillips* was to be applied to gas producers, *i.e.*, oil companies.

The incidents of the new planned economy inevitably go far beyond the derivation by the Commission of fair and reasonable prices for natural gas. For example (1) in respect of new gas coming on the market, unit price fixing at prices less than market value necessarily implies allocation of the gas, under Commission standards, in the usual case where the low-cost gas is sought by two or more interstate pipelines. (2) Exploration is, of course, in large part a function of profit potential; in the budgeting of oil company expenditures, there is competition for exploration money between various departments of the major companies. Cf. Tr. 49, 233–34. Therefore, to an undefined extent, Commission pricing must in advance plan for and allow for incentive to explore, particularly where the potential discovery is more likely to be gas than oil. (3) Overtures towards the standardization of gas sales contracts pursuant to Commission orders have already been made. *Notice of Proposed Additions to the Commission's Statements of General Policy* (etc.), Docket No. R. 200; *Non-Acceptability of Contracts* (etc.), Docket No. R. 199, both issued May 22, 1961.

In general, from the initial budgeting for exploration to final connection of new gas, the Commission necessarily will be involved in the previously private transactions of gas producers, as Commission regulation evolves towards firm price control.

By the time of *Catco* (cited *supra*), June 22, 1959, the Commission had not settled on a method of pricing gas within the frame of reference of the Natural Gas Act. The Commission has felt that framework to be inappropriate, and has called for new legislation. F.P.C. Annual Reports: 1955, p. 18; 1956, p. 19; 1957, pp. 25–26; 1958, pp. 15–16; 1959, pp. 18–19; 1960, p. 17. Meanwhile, gas prices paid to producers by interstate pipelines continued to rise rapidly. Alarm over the continued steep rise in prices for new gas on the prevailing sellers' market, and the absence of an effective plan by the Commission for price control, motivated the "strictures" [4] of *Catco*, as is evident from the Court opinion. However, the Supreme Court did not there direct that the planned economy for the gas aspects of the oil production industry should be based on the cost-of-service conventions of the public utility business in the regulation of pipelines under the Natural Gas Act. The net effect of *Catco* is a direction to the Commission

[3] *Phillips Petroleum Co.* v. *Wisconsin*, 347 U.S. 672, decided June 7, 1954.

[4] Hastie, J., dissenting in *United Gas Improvement Co.* v. *F.P.C.*, 269 F. 2d 865, 869; reversed and remanded, 361, U.S. 195.

to hold the price line, while methods of price control are being worked out. This has been characterized as a "stop-gap device" with the "objective of providing simple, direct, and effective stop-gap protection for the consuming public." *United Gas Improvement Co.* v. *F.P.C.*, 283 F. 2d 817, 822, 823, (CA9), *cert.* denied, 365 U.S. 879 and 881.

Neither *Catco* nor subsequent court decisions specify with any degree of exactitude where the "price line" is, or what standards are to be used in its determination. The Commission has for present purposes clarified the problem of the correct approach to the price line by establishing "area rate levels" setting forth, *inter alia*, a schedule of initial prices for new gas connections under new contracts within specified geographical areas that are "convenient and well known," but "not necessarily in complete accord with geographical and economic factors which may be relevant," *i.e.*, geographical areas that are subject to revision. *Statement of General Policy No. 61–1*, 24 FPC 818, 819. Presumably, these initial prices will at some future time be set on the basis of the "reasonable financial requirements" of the oil industry and at levels "adequate to maintain the gas supplies needed by the consumers of the nation," but no higher than "necessary to accomplish that purpose." *Phillips Petroleum Co.*, 24 FPC 537, 547; appeal to CADC pending, No. 16175. Presumably, such future initial prices will be based on solid facts backing up a Commission determination of the correct price for new gas, replacing the solid facts of the marketplace (expressed in a negotiated price) as to the value of the gas.

For the time being, the Commission, lacking more exact standards, finds the correct price for given new gas on the basis of the existing finally certificated prices for other supply in the general area. See, *e.g.*, *Texaco, Inc.* v. *F.P.C.*, 290 F. 2d 149 (CA5); *Humble Oil & Refining Co.*, 24 FPC 191; *Natural Gas Pipeline Co. of America*, 24 FPC 222, 305; *Peoples Gulf Coast Natural Gas Pipeline Co.*, 24 FPC 1, 106, 323; see also other cases cited herein.

Finally, and most importantly, the "area rate levels" thus found, at least in respect of new gas such as is involved in the case at bar, are in no way necessarily related to "fair and reasonable" rate levels under any definition of that term. The area rate levels express the history of "open-market" prices at a given point of time in a given place. A record such as the one before the Commission in this case, under the area pricing policy, is properly devoted to a listing and comparison of existing gas prices for other transactions in the area, as deemed relevant by the parties to the record. In the very nature of the inquiry, it is impossible to determine from such other prices what is the "lowest possible reasonable rate consistent with the maintenance of adequate service"[5] for the Red Wash gas. The record in this case is devoid of specific evidence upon which such a reasonable rate could be determined; evidence in this regard is unnecessary at the present stage in the evolution of pricing policy, in which attention is focused on other area prices for similar gas.

Otherwise stated, the correct price criterion is a comparison of the value of and price of the Red Wash gas to El Paso, with the value of and price of other gas sold in the area. From this postulate, two conclusions follow:

1. Producer costs in respect of the Red Wash gas are irrelevant. The fact that the Red Wash "gas production is strictly a by-product operation," that "the gathering system and compression facilities were not constructed for the purpose of making the instant sale to El Paso," and that "very little capital has been invested for the specific purpose of finding, collecting, processing and compressing the natural gas involved in these proceedings" (Southern California

[5] *Catco*, 360 U.S. at 388, quoted with approval in *P.S.C. of New York* v. *F.P.C.*, 287 F. 2d at 150 (CADC).

distributors' Brief, p. 20) is of no significance. Only the result—comparative quality of the gas, comparative volume, comparative delivery point, comparative accessibility of the supply—is of significance.

2. Considerations of the price necessary to preserve and enhance the "incentive" of the producers to explore for and develop nautral gas resources are not given weight in the derivation of the proper initial price for gas, under current "stopgap" (*supra*) judging techniques. The extensive argument of Stancal (Br. 15–19, Reply Br. 6–8) for the maintenance of incentive to explore in the rugged, expensive areas of Utah is irrelevant to the only issue: comparability of the contract price with the allowable price, which is derived solely from previously accepted similar sale transactions.

PRICE COMPARISONS

In connection with the truism that the Commission's area pricing policy ultimately reflects *value of gas*, as established in prior, acceptable, open market transactions, a further truism must be kept in mind: that the value of given "packages" of gas varies widely. At opposite extremes, we may have a sale of small quantities of low Btu, low pressure, sour, inaccessible gas to be picked up by the pipeline at the wellhead on the one hand, and a sale of large quantities of high Btu, high pressure, pipeline quality gas delivered to a mainline on the other hand. Price adjustments should be made to reflect such variations. *United Gas Improvement Co.* v. *F.P.C., supra; Cities Service Gas Co.*, 14 FPC 134, 141, 146, aff'd. *sub nom Signal Oil & Gas Co.* v *F.P.C.* 238 F. 2d 771 (CA3), *cert.* denied, 353 U.S. 944; *Transwestern Pipeline Co.*, 22 FPC 391, 396–401; *El Paso Natural Gas Co.*, 23 FPC 369, 376.

In the case of Red Wash, the transaction involves some 4,100,000 Mcf annually (11,250 Mcf per average day) of 985 Btu pipeline quality gas at 900 pounds pressure, delivered at a central point in the field to El Paso's lateral connecting with the main pipeline. The reserves are estimated at 180 million Mcf, of which 82 million Mcf are covered by the present contract.

Staff presents sales from two fields, both in Utah, as a basis for price comparison. *First*, Staff cites sales from the so-called "Bar–X" field, southeast of Red Wash, on the Utah-Colorado border. These sales are of wellhead gas, as 500 pounds pressure, 1,000 Btu content, and at a price of 12 cents per Mcf. The contracts for Bar-X, entered into in 1957 and 1958, cover 2,331,000 Mcf of gas deliveries annually, per Staff estimate, or 1,756,267 Mcf delivered in 1959, per Stancal presentation. Stancal points out that El Paso must compress this 500 pound gas to 600 pounds for delivery into its mainline, and that under its contracts therefor, as the field pressure declines, El Paso must gather the gas at pressure as low as 100 pounds and supply the necessary compression.

Second, Staff cites sales from the Westwater field, lying west of Bar-X, in Grand County, Utah. These sales involve some 16 miles of gas transmission to El Paso's mainline, over a lateral constructed by the producers. *Oil, Inc. et al.*, 25 FPC 1178, Docket Nos. CI60–170 and CI60–171, issued June 20, 1961. Eliminating transmission costs borne by the producers and reimbursed by El Paso through a 5.5 cents per Mcf differential, the sales are at 12 cents per Mcf for wellhead gas, at 900 pounds pressure and of 900–985 Btu content. The contract, entered into in 1959, covers 3,240,000 Mcf (per Staff estimate) of gas deliveries annually. Stancal points out that during the six months of each year from October 1 through March 1, the gas will be of only 900 Btu content, and that average initial delivery volumes of 9,000 Mcf per day are expected to decline to as low as 3,000 Mcf per day within three to six years, at which time the annual volumes will be a little over one million Mcf. El Paso's total expense

for the connection of this supply was $8,933 for a tap on the mainline and a meter. *El Paso Natural Gas Co.*, 23 FPC 287, 288, filing of March 1, 1961, pursuant to paragraph (B) of order.

Stancal, in its Exhibit 2, presents sales from several fields in Utah, southwestern Wyoming, and northwestern Colorado as a basis for price comparison. The principal fields cited by Stancal, in addition to Bar–X and Westwater, are:

(1) The Aneth field in the Paradox Basin of southeastern Utah. Disregarding the "wash" transaction under which El Paso picks up the gas and processes it in return for revenues from liquids, and disregarding production by El Paso and its affiliate from the field, the Aneth sale involves some 34 million Mcf annually (93,000 Mcf per average day) of 950 Btu pipeline quality gas at 850 pounds pressure, delivered at a central point in the field, under contracts entered into at various dates in 1957, 1958, 1959, and 1960.[6] The sale is permanently certificated at a price of 17.7 cents per Mcf, under Commission-imposed reduction of the 20 cent contract price. *El Paso Natural Gas Co.*, 23 FPC 369, 371–373, 383, 391–393, affirmed *sub nom Texaco, Inc.* v. *F.P.C.*, 290 F. 2d 149 (CA5).

(2) Various fields, including Dry Piney, East LaBarge, Big Piney, and Hogsback, mostly in Sublette County, Wyoming. As to the East LaBarge field gas, it appears that delivery at 860 pounds pressure and in volumes of 6,000-8,000 Mcf per day of 950 Btu gas has been authorized at a price of 15 cents per Mcf at 14.65 psia (15.384 cents at 15.025 psia), reduced from the contract price of 16 cents. *Humble Oil & Refining Co.*, 24 FPC 191. El Paso paid $44,677 for pipe and appurtenances to connect this supply. Filing of March 1, 1961, pursuant to 23 FPC 288, *supra*. In a recent initial decision, other fields in the same area were price conditioned by reducing the 18.5 cent contract price to 15 cents at 14.65 psia (15.384 cents at 15.025 psia). *El Paso Natural Gas Co.*, Docket No. CP60–72; initial decision issued August 25, 1961.

(3) The South Rangely field of Rio Blanco County, Colorado. Rio Blanco is adjacent to Uintah County, Utah, and the South Rangely field is some 65 miles from Red Wash. In the case of South Rangely, 950 Btu gas at 860 pounds pressure, without daily obligated delivery, and with only 5,200,000 Mcf total proven reserves, was permanently certificated by the Commission at 16 cents per Mcf. *Pacific Northwest Pipeline Corp.*, 22 FPC 117. The decision apparently involved a sale at the wellhead, and only one connected well. However, the South Rangely "strike" was apparently immediately adjacent to the Pacific Northwest (now El Paso) mainline, subject to connection without investment in a lateral line. See Exhibit 5. Considering the above proposed comparisons in reverse order:

Analysis of Prior Certificated Sales. (1) The certificaiton of South Rangely at 16 cents is not controlling on the price for Red Wash gas. That certification was made July 23, 1959, prior to a number of court decisions reemphasizing the Commission's duty to hold prices for new gas at the lowest possible levels, and the decision was in effect, although not in words, repudiated in the *Humble* case, *supra*, 24 FPC at 193–194.[7] The arguments from the South

[6] The *availability* of this amount was, however, limited to a period ending in 1962, and will fall to 36,000 Mcf per average day in 1973. See public findings in Docket Nos. G–12580 and G–13862. The wide variation in availability of gas over the term of the contract disadvantages El Paso, and perhaps tends to equalize the volume differential between Aneth and Red Wash.

[7] The distinctions made in the *Humble* opinion are unconvincing. There is no reason, except a change towards stricter pricing, for the Commission's refusal to adopt the South Rangely price for the Humble sale to the same market. The blunt fact is that subsequent court action on many of the July–August 1959 Commission certifications makes the correctness of those certifications subject to grave doubt. See discussion in *Gulf Oil Corp.*, 23 FPC 664, 677 and footnote 13; *Panhandle Eastern Pipe Line Co.*, initial decision of July 11, 1961, 27 FPC 53 at 70, footnote 23.

Rangely certification were thoroughly presented by Stancal and Gulf in their motions seeking amendmnet of the temporary authorizations herein, in which motions applicants specifically asked for "at least" or "not less than" 16 cents per Mcf at 15.025 psia. Filings of May 16 and August 1, 1960, *supra*, note 2. The Commission denied the amendment.

The Commission by its condition and Stancal by connecting the gas have effectively renegotiated the Red Wash contract, *pro tem*, at a 15 cent initial price. That 15 cent price has no more or less intrinsic justification than the 18.5 cent negotiated price, in terms of a "fair and reasonable" price. In terms of an upward price change in the *status quo* the South Rangely certification is insufficient, in the light of the other prices discussed herein, to warrant that result.

(2) The various sales from Sublette County and Sweetwater County in Wyoming, partly considered in the *Humble* and *El Paso* (Docket No. CP60–72) decisions, *supra*, are of substantial weight in the derivation of the correct price for the Red Wash gas. Those sales involve gas (a) from nearby, similar territory in Wyoming (*supra*), (b) destined to the same market, and (c) of substantial quantities. Exh. 2, items 21–25, 33–47. Substantially all of the Wyoming gas is certificated at 15 cents at 14.65 psia, the price set in *Humble*, 24 FPC at 195. Since Utah, southwestern Wyoming, and northwestern Colorado gas is always priced and sold at 15.025 psia, Exh. 2 herein, and the use of the 14.65 psia pressure base in the *Humble* order is entirely unexplained, it may be assumed that such use was inadvertent, and an error not to be compounded by extension into the area of Red Wash now under consideration. Consequently, the correct price "line" indicated by the Wyoming sales is 15 cents per Mcf at 15.025 psia (14.63 cents per Mcf at 14.65 psia), as set out in the temporary authorizations herein.

(3) The sales from the Aneth field are disregarded in the determination of the correct price for Red Wash gas, because the Paradox Basin, the site of the Aneth field, is not part of the geographical pricing area in which Red Wash is located. Aneth gas moves to California over El Paso's southern system: price competition (Transwestern Pipeline Company) is involved. The Paradox Basin is in the northern part of a geological, geographical, and "shopping" area in which price standards are derived from the San Juan Basin of New Mexico. *El Paso Natural Gas Co.*, 23 FPC 369 (*supra*). True, Stancal's contract official seems to have given substantial weight to the Aneth Prices in negotiating the 18.5 cent price presently in question (Tr. 127). True, there is no reason to question, and every reason to accept, his judgment as to the bases and end-result of a fair bargain for new gas on the open market. But as the courts and the Commission have now made clear, the derivations of the contract official in this regard are irrelevant in the usual case where price comparisons within an area can be made by the Commission. Applying the "stopgap" technique, the correct price *pro tem* is to be based only on such comparisons.

(4) The Westwater sales, essentially at 12 cents per Mcf, involve gas soon to be of small volumes in respect of deliverability and in large part of subnormal Btu content. Adjustments necessary to make Westwater a standard of comparison for Red Wash would be impossible of calculation.

(5) The Bar-X sales of 500 pound pressure wellhead gas have been adjusted for gathering, processing and compression, by Stancal computations indicating a current cost to El Paso of: 12 cents per Mcf to the producers, 3.7 cents per Mcf for gathering and processing, and 2.3 cents per Mcf for compression, or a total of 18 cents per Mcf. However, Stancal's computations derive solely from two selected pages of a 1959 annual report filed with the Commission by El Paso's predecessor. Neither the computations nor the basis therefor were

substantiated by an El Paso or other competent witness. Costs incurred by El Paso in respect of Bar-X gas as computed for 1959 may or may not be representative on the one hand, or over-stated on the other.

Stancal's computations, for instance, make no allowance at all for the comparative cost of El Paso's laterals to Bar-X and Red Wash. The lateral to Bar-X cost $102,528. *Pacific Northwest Pipe Line Co.*, Docket No. G–10425, Exh. A to application. The Red Wash lateral, as we have seen, cost over four times that amount.

If new gas is to take a price based on an adjustment of a prior certificated price, as the Commission did in respect of the Aneth field gas, *supra*, the adjustment must be certain and precise. In the case at bar, all that can be said with certainty is that the Red Wash gas is worth more to El Paso than the Bar-X gas, a fact already reflected in the price differential resulting from open-market (value) negotiations, and now in issue.

Conclusion on Price Line and Area. Based on the evidence adduced herein as to geological, geographical, historical, marketing, and operating characteristics of the general region as presented in the record, it is found that the appropriate pricing area is northeastern Utah, northwestern Colorado, and southwestern Wyoming.

This area coincides with that proposed by the Southern California distributors, except for the omission of northwestern Utah, as to which this record contains insufficient evidence for the making of a determination. This area differs from that proposed by Staff, the California Commission, and PG&E, all of whom propose the entire State of Utah as a pricing area, because the Paradox Basin of southeastern Utah lies in an area of totally different characteristics.

In the pricing area thus determined, there is insufficient basis in the record for either raising or lowering the 15 cent level at which the Red Wash gas is currently being delivered. The Wyoming sales support this level as being the correct existing price "line." The Utah and Colorado sales do not require a different conclusion. The 15 cent price should therefore be established, *pro tem*, as the correct initial price for sales from Red Wash, pending "area" or other proceedings looking towards a solid basis in economic facts as to the derivation of a different price.

Other Issues

Aside from the question of the proper price "line," based on the evidence as to preexisting sales of gas, the following additional contentions are made:

1. *Take-or-pay-for Contract Provision.* The Southern California distributors contend that the present contracts contemplate 100 percent take-or-pay-for, and that the Commission should "adopt a policy, applicable generally throughout the industry, of cutting back take-or-pay-for provisions from 100 percent to 80 percent" (Br. 25). The contention is qualified by the recognition that *ad hoc* treatment, *e.g.*, limited to El Paso's contracts such as the one now in question, would result in discriminatory disadvantage.

El Paso's obligation to take gas is expressed on an annual basis (365 times average daily take of 11,250 Mcf), and that obligation is equal to the annual obligation of the producers to deliver gas. Consequently, the contract provides for 100 percent take-or-pay-for, notwithstanding the permitted daily variation in take between a floor of 7,500 Mcf and a ceiling of 15,000 Mcf, which provides a "swing" advantageous to El Paso, and the advantage of a five-year period allowed El Paso for make-up of undertakes.

In recognition of the take-or-pay-for problem, the Commission has, pursuant to the Administrative Procedure Act, issued its Notice of Proposed Rulemaking, providing, *inter alia*, for a rule that "the annual quantity of gas to be paid for

by buyer, if not taken, shall not be greater than eighty (80%) percent of the daily-contract-quantity multiplied by the number of days in the year." Par. 4A(5) of Docket R. 199, issued May 22, 1961.

The rule, if adopted, will of course, not have retroactive application to a contract such as the one here involved, entered between El Paso and Stancal on January 27, 1960. The rule will operate prospectively, and its effect will be felt equally by all producers entering into gas sales contracts.

As the Southern California distributors seem to recognize implicitly, the matter of standardization of take-or-pay-for clauses is not properly to be effected by *ad hoc* revision of such contracts as may be reviewed in formal hearings, because this would result in discrimination and unequal treatment. Standardization and cut back or take-or-pay-for quantities can only be accomplished properly when effected by general order of the Commission applicable to all producers similarly situated. There is no concrete evidence of specific harm to El Paso resulting from the provision for 100 percent take-or-pay-for in the contract here involved other than the asserted interest of all consumers in a general rule providing for an 80 percent factor. The contention, therefore, is disallowed.

2. *Proof of "Need" for Gas.* The California Commission contends (Br. 5–8) that the applications should be dismissed because El Paso has not proved that it needs the Red Wash gas. However, El Paso's need for new gas supplies to meet its rapidly expanding California markets is a matter of common expert knowledge of this Commission, publicly declared. *El Paso Natural Gas Co.*, 23 FPC 369, 476; *idem*, 23 FPC 213; *idem*, 22 FPC 900, 903–904; *idem*, 19 FPC 393, 394–397; *idem*, 16 FPC 1354, 1357.

Insofar as the Red Wash gas is destined to be served to the territory formerly served by Pacific Northwest Pipeline Corporation, rather than to the California market, "need" is demonstrated by the Commission's specific reservation of 30,000 Mcf, peak day, for the northwest territory, from gas otherwise needed in California. *Pacific Gas Transmission Co.*, 24 FPC 134, 140.

It may be noted that the California Commission's contention was not specifically advanced during the hearing, when it could have been answered with concrete evidence that El Paso still has the need for gas so recently and so often determined by this Commission. The current findings of the Commission in such recent cases, added to the evidence in the record (R. 168–169) amply demonstrate El Paso's market and need for the Red Wash gas. In the California Commission has any evidence or basis for contending otherwise, which is to be doubted, the matter should be advanced at a hearing rather than on brief.

3. *Cost of Service Evidence.* The California Commission contends (Br. 22) that "some" evidence as to the costs incurred in the production of the Red Wash gas is necessary in the determination of a proper initial price therefor in this proceeding, and that absent voluntary submission of such cost evidence, the Commission should either (a) require that such evidence be produced, or (b) deny the certificates. Reference to the some 17 items of information specifically requested by the California Commission shows that investment, operating expenses, allocation of these two factors between oil and gas production, and ultimately, return to the producers from the investment in the Red Wash unit, are the categories of evidence which that Commission deems necessary to complete this record. (Tr. 77–84, 326–330.) [8]

[8] The request, as made, was substantially for the issuance by the Examiner of a subpoena duces tecum for Stancal records. However, according to a ruling of the Commission, Examiners are not authorized to issue subpoenas. *East Tennessee Natural Gas Co.*, 23 FPC 629.

Evidence of producer costs has never been held by the courts to be necessary to the determination of initial prices consonant with the public convenience and necessity; the indications, beginning with *Catco*, are to the contrary. *Atlantic Refining Co.* v. *F.P.C.*, 360 U.S. 378, 388; *United Gas Improvement Co.* v. *F.P.C.*, 283 F. 2d 817, 823 (CA9), *cert.* denied 365 U.S. 831; *United Gas Improvement Co.* v. *F.P.C.*, 287 F 2d 159, 161 (CA10); *P.S.C. of N.Y.* v. *F.P.C.*, 287 F. 2d 146, 148 (CADC), *cert.* denied 365 U.S. 880; *Texaco Inc.* v. *F.P.C.*, 290 F. 2d 149, 157 (CA5).[9] The decisions make the reason clear: "cost" evidence to be meaningful would involve unduly complicated and lengthy proceedings delaying initial gas connections. Beginning with *Phillips*, it has been clear that the Commission is not going to require cost evidence, such as that sought by the California Commission, in rate cases, *a fortiorari* as to certificate cases. *Phillips Petroleum Co.*, 24 FPC 537; *Permian Basin Proceeding*, 25 FPC 614, Docket AR61–1, order of April 5, 1961.

On the basis that there is no rule or policy of the Commission or the courts requiring cost-of-service justification of proposed initial rates, and that there is a Commission policy to the contrary, the contention of the California Commission is denied. The Commission has adopted area price "lines," not cost-of-service, as the standard for judging the convenience and necessity of proposed initial prices. *Statement of General Policy 61–1*, and discussion, *supra*. Such price "lines," or ceilings, are a function of market history as to value of gas for the time being in given areas, and are totally unrelated to producer cost-of-service for given supplies of gas.

Formal Conclusions of Fact

(1) Each of the applicants listed in the caption hereof is engaged in the transportatin and/or sale of gas in interstate commerce for resale for ultimate public consumption and is, therefore, a "natural-gas company" as defined in the Natural Gas Act, and each of said applicants is an "independent producer" as defined in the Commission's Regulations Under the Natural Gas Act.

(2) The sales and deliveries of gas in interstate commerce by said independent producers involved in these proceedings, and the facilities therefor, are required by the public convenience and necessity, at a price (initial rate) of 15 cents per Mcf at 15.025 psia, and certificates authorizing such sales should issue to each of them in accordance with the terms of this Decision and Order.

Order

Wherefore, It Is Ordered, subject to review by the Commission, that:

(A) Certificates of public convenience and necessity hereby are issued to Standard Oil Company of California, Dorsey Buttram, George P. Caulkins, Jr., and Gulf Oil Corporation, for the sale as proposed of natural gas in interstate commerce for resale, together with the construction and operation of any facilities subject to the jurisdiction of the Commission necessary therefor, upon the terms and conditions of this order.

(B) As a condition to the authorizations herein granted, the initial price for the sale of gas as proposed to El Paso shall be 15 cents per Mcf at a pressure of 15.025 psia in substitution for the initial price provided for in the contracts and the producers shall file supplements to their filed rate schedules reflecting the 15 cent price.

---

[9] In *Texaco*, the California Commission presented the same argument on brief, but the Fifth Circuit did not specifically deal with the argument, although ruling against it *sub silentio*.

(C) The certificates herein issued shall be accepted in writing, under oath, within 30 days from the date of issuance of this order.

(D) The certificates isued herein are not transferable and shall be effective only so long as each of the applicants continues the acts and operations herein authorized in accordance with the provisions of the Natural Gas Act and the applicable rules, regulations, and orders of the Commission.

(E) The grant of the certificates herein shall not be construed as a waiver of the requirements of Section 4 of the Natural Gas Act or Part 154 of the Commission's regulations thereunder, requiring the filing of rate schedules for the service herein authorized, and is without prejudice to any findings or orders which have been or hereafter may be made by the Commission in any proceeding now pending or hereafter instituted by or against the applicants.

ROBERT M. WESTON,
Presiding Examiner.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

UNITED GAS PIPE LINE COMPANY, DOCKET NO. CP62-208

FINDINGS AND ORDER ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued June 11, 1962)

On March 5, 1962, United Gas Pipe Line Company (Applicant) filed in Docket No. CP62-208 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction and operation of new delivery points and the sale and delivery of natural gas to United Gas Corporation for resale and distribution, all as more fully set forth in the application.

Applicant proposes to construct and operate the following facilities:

(1) A 2-inch tap valve at approximate Milepost 100 at a point in Section 12, Township 3 North, Range 2 East, on Applicant's 30-inch South-to-North Louisiana line to serve the communities of Effie and Center Point, Avoyelles Parish, Louisiana;

(2) A 2-inch tap valve at approximate Milepost 109.23 at a point in Section 31, Township 5 North, Range 2 East, on Applicant's 30-inch South-to-North Louisiana line to serve the communities of Buckeye, Deville, and Holloway, Rapides Parish, Louisiana; and

(3) A 2-inch tap valve at approximate Milepost 111.64 at a point in Section 12, Township 5 North, Range 2 East, on Applicant's 30-inch South-to-North Louisiana line to serve the community of Hickory Grove, Rapides Parish, Louisiana.

United Gas Corporation will construct and operate the distribution systems in the various communities. The estimated gas requirements in Mcf at 14.9 psia are as follows:

	Annual	Peak day
First year	72,818	725
Third year	76,625	770

Applicant estimates that the cost of the proposed facilities will be $1,470, which will be financed from current working funds.

Pursuant to due notice, a public hearing was held in Washington, D.C., on May 29, 1962, respecting the matters involved in and the issues presented by the application herein. No protest to the granting of the application or petition to intervene has been received. Staff counsel moved orally at the hearing that the intermediate decision procedure be omitted and that the Commission render a decision herein pursuant to Section 1.30(c)(1) of its Rules of Practice and Procedure.

The Commission finds:

(1) Applicant, United Gas Pipe Line Company, a Delaware corporation having its principal place of busness in Shreveport, Louisiana, is a "natural-gas company" within the meaning of the Natural Gas Act as heretofore found by the Commission in its order of January 20, 1952, in Docket No. G–216 (3 FPC 3).

(2) The facilities hereinbefore described, as more fully described in the application in this proceeding, are to be used in the transportation and sale of natural gas in interstate commerce subject to the jurisdiction of the Commission, and the construction and operation thereof and the transportation and sale of natural gas by Applicant are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules, and regulations of the Commission thereunder.

(4) The construction and operation of the proposed facilities and the proposed sales of natural gas by Applicant are required by the public convenience and necessity, and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulation under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4), and (e) of Section 157.20 of said Regulations.

(6) A request during the public hearing by staff counsel for omission of the intermediate decision procedure herein was unopposed by any party of record and, not having been denied by the Commission, is granted pursuant to Section 1.30(c)(1) of the Commission's Rules of Practice and Procedure.

The Commission orders:

(A) A certificate of public convenience and necessity be and the same is hereby issued authorizing Applicant, United Gas Pipe Line Company, to construct and operate the proposed facilities and to sell and deliver natural gas, as hereinbefore described, all as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4), and (e) of Section 157.20 of said Regulations.

(C) The facilities hereby authorized shall be constructed and placed in actual operation and the sales of natural gas authorized in paragraph (A) above shall commence, as provided by paragraph (b) of Section 157.20 of the Commision's Regulations under the Natural Gas Act, within one year from the date on which this order issues.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

COASTAL TRANSMISSION CORPORATION, DOCKET NO. CP62-231

FINDINGS AND ORDER ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued June 12, 1962)

On April 2, 1962, Coastal Transmission Corporation (Applicant) filed in Docket No. CP62-231 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction during the 12-month period commencing July 1, 1962, and the operation of field facilities to enable Applicant to take into its certificated main pipeline system natural gas which will be purchased from producers thereof, all as more fully set forth in the application.

The purpose of this budget-type application is to augment Applicant's ability to act with reasonable dispatch in contracting for and connecting to its pipeline system new supplied of natural gas in various producing areas generally coextensive with said system.

The total cost of the proposed facilities will not exceed $1,500,000, with no single project to exceed a cost of $300,000, and will be financed from short term bank loans.

Pursuant to due notice, a public hearing was held in Washington, D. C. on May 31, 1962, respecting the matters involved in and the issues presented by the application herein. No protest to the granting of the application or petition to intervene has been received. Staff counsel moved orally at the hearing that the intermediate decision procedure be omitted and that the Commission render a decision herein pursuant to Section 1.30 (c)(1) of its Rules of Practice and Procedure.

The Commission finds:

(1) Applicant, Coastal Transmission Corporation, a Delaware corporation having its principal place of business in Houston, Texas, is a "natural-gas company" within the meaning of the Natural Gas Act as heretofore found by the Commission in its opinion and order of December 28, 1956, in Docket Nos. G-9262 and G-9960 (16 FPC 118).

(2) The facilities hereinbefore described, as more fully described in the application in this proceeding, are proposed to be used in interstate commerce, subject to the jurisdiction of the Commission, and the construction and operation thereof by Applicant are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules, and regulations of the Commission thereunder.

(4) The construction and operation of the facilities to take natural gas purchased from producers thereof as proposed by Applicant are required by the public convenience and necessity, and a certificate therefor should be issued as hereinfater ordered and conditioned.

(5) Public convenience and necessity requires that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a) and (e) of Section 157.20 of said Regulations.

(6) It is necessary and appropriate in carrying out the provisions of the Natural Gas Act that Applicant should submit on or before September 1, 1962, a statement under oath showing by projects: (a) names of fields connected, (b) estimates of gas supplies attached, (c) a description of the project or projects that have been constructed pursuant to the authorization hereinafter granted, (d) the location of said project or project, (e) the actual final costs of said facilities, and (f) the names of the independent producers involved, together with the dates of the gas sales contracts FPC gas rate schedule numbers, and the docket numbers of the related producer certificate applications.

(7) The authorization hereinafter granted should be limited to construction during the 12-month period commencing July 1, 1962, and the total expenditures for facilities to be constructed thereunder should be limited to a maximum of $1,500,000 with no single project to exceed a cost of $300,000.

(8) A request during the public hearing by staff counsel for omission of the intermediate decision procedure herein was unopposed by any party of record and, not having been denied by the Commission, is granted pursuant to Section 1.30 (c) (1) of the Commission's Rules of Practice and Procedure.

The Commission orders:

(A) Upon the terms and conditions of this order, a certificate of public convenience and necessity be and the same is hereby issued authorizing Coastal Transmission Corporation to construct during the 12-month period commencing July 1, 1962, the proposed facilities hereinbefore described, as more fully described in the application in this proceeding, and to operate such facilities only to take natural gas supplies from producers who have received authorization from the Commission to sell natural gas to Coastal Transmission Corporation.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a) and (e) of Section 157.20 of said Regulations.

(C) Applicant shall submit, on or before September 1, 1962, a statement under oath showing by project: (a) names of fields connected, (b) estimates of gas supplies attached, (c) a description of the project or projects that have been constructed pursuant to the authorization hereinbefore granted, (d) the location of said project or projects, (e) the actual final cost of said facilities, and (f) the names of the independent producers involved, together with the respective dates of the gas sales contracts, the FPC gas rate schedule numbers, and the docket numbers of the related producer certificate applications.

(D) The authorization granted in paragraph (A) above is hereby limited to construction during the 12-month period commencing July 1, 1962, and the total expenditures for facilities to be constructed thereunder are hereby limited to a maximum of $1,500,000, with no single project to exceed a cost of $300,000.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

NORTHERN STATES POWER COMPANY, DOCKET NO. E-7035

SUPPLEMENTAL ORDER AUTHORIZING THE ISSUANCE OF FIRST MORTGAGE BONDS

(Issued June 12, 1962)

By order issued May 24, 1962, in the above-entitled matter, the Commission authorized Northern States Power Company (Applicant) to issue and sell at competitive bidding $15,000,000, principal amount of First Mortgage Bonds, due 1992, subject to the provisions, among others, set forth in Paragraph (B) of that order, as follows:

(B) The proposed issuance and sale of Bonds at competitive bidding shall not be consummated until:

(i) Applicant shall have amended its application pursuant to the requirements of Section 34.2(k)(3) of the Commission's Regulations under the Federal Power Act relating to compliance with competitive bidding requirements, and Section 34.2(k)(4) of those Regulations relating to affiliation, and shall have either filed such amendments or shall have mailed them and advised the Commission by telephone and telegraph, as contemplated in Section 34.9 of the Regulations.

(ii) The Commission, by further order, shall have approved the price to be received by Applicant for the proposed issuance of Bonds and the interest rate thereof.

Applicant, on June 12, 1962, filed an amendment,, pursuant to the requirements of the afore-mentioned Commission order, setting forth, among other things, that it proposes to accept, as providing the lowest annual cost of money to it, thee bid of Halsey, Stuart & Co., Inc. to purchase the proposed issuance of $15,000,000, principal amount of Bonds, for the price of 100.91% of principal amount, with an interest rate of 4⅜%.

The Commission finds:

(1) Applicant has satisfactorily complied with the requirements of paragraph (B) of the Commission's order issued May 24, 1962, in the above docket, and under the bid it proposes to accept for the Bonds, the price to be received by Applicant therefor and the interest rate thereof are reasonable.

(2) The proposed issuance and sale of Bonds, as hereinafter authorized, will be for a lawful object, within the corporate purposes of the Applicant and compatible with the public interest, which is appropriate for and consistent with the proper performance by the Applicant of service as a public utility and which will not impair its ability to perform that service, and is reasonably necessary and appropriate for such purposes.

The Commission orders:

(A) The price to be received by Applicant for the proposed Bonds and the interest rate thereof under the bid referred to above are approved as reasonable.

(B) The proposed issuance and sale of Bonds referred to above, upon the terms and conditions and for the purposes specified in the application, as supplemented by the amendment referred to above, are hereby authorized subjct only to the provisions of paragraphs (A), (C), (D), and (E) of the Commission's order issued May 24, 1962 in the above docket.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

TENNESSEE GAS TRANSMISSION COMPANY, DOCKET NO. G–16842

ORDER AMENDING ORDER GRANTING RECONSIDERATION AND ISSUING TEMPORARY AUTHORIZATION

(Issued June 12, 1962)

On February 16, 1962, Applicant filed a motion requesting amendment of the temporary authorization issued herein on August 30, 1961. No party has opposed the motion. This matter stems from the certificate issued herein on May 12, 1959, by order accompanying Opinion No. 320, 21 FPC 653, which authorized, among other things, construction of some 158 miles of loop lines by Applicant along its Kinder-Portland pipeline. On March 27, 1961, Applicant filed a motion to amend the Opinion No. 320 certificate, averring that it had not constructed the authorized Kinder-Portland loop lines and instead desired authority to install additional compression facilities on its Delta-Portland pipeline. We set Applicant's motion to amend for formal hearing.

On June 23, 1961, Applicant filed a request for temporary authorization to install and operate the substitute Delta-Portland compressor facilities. On July 21, 1961, we denied the request for temporary authority. On August 4, 1961, Applicant field a petition for reconsideration of the denial. Granting reconsideration, on August 30, 1961, we issued temporary authorization pursuant to Section 7 of the Natural Gas Act subject to the condition, among others, of ordering paragraph (B) that:

> (2) The aforesaid facilities shall not be used as occasion to withdraw any greater volumes of gas from the Bastian Bay Field than those being withdrawn prior to the issuance of this order.

It is this restriction which Applicant now asks us to remove.[1] Our orders of July 21 and August 30, 1961, discuss the background of that restriction.

In its motion to amend Applicant avers that the maximum volume withdrawn from the Bastian Bay Feld and delivered into Applicant's system prior to issuance of our order of August 30, 1961, was 55,000 Mcf per day (delivered on April 18, 1961). Applicant also says that

> * * * experience has proved that the condition has imposed, and will continue to impose, a serious burden upon Tennessee and is detrimental to the public interest.
>
> This condition if continued in effect will result in drainage of the Bastian Bay gas, will result in higher cost for such gas and also seriously restrict Tennessee's ability to operate its system in the most efficient and desirable manner.

In support of these contentions Applicant states:

(1) Applicant is only one of four major interest owners in the Bastian Bay Field;

(2) A second major owner, Phillips Petroleum Company, is currently delivering its natural gas production to Southern Natural Gas Company;

---

[1] Applicant's motion fails to describe this restriction precisely and its prayer for relief requests removal of "the condition contained in Ordering Paragraph (B) (1)"; but since Applicant fails to state any ground for removing condition (B) (1), and does present arguments germane to condition (B) (2), we construe the motion to amend as speaking to this latter condition.

(3) Applicant "is advised" that Tidewater Oil Company and Gulf Oil Corporation "contemplate substantially increasing deliveries to United Gas Pipe Line Company" under an existing gas purchase contract[2] "upon completion of United's new pipeline out of the field on or about March 1, 1962";

(4) The Commissioner of Conservation of the State of Louisiana has established production units and field rules for production of natural gas from the Bastian Bay Field by orders effective December 1, 1961. Basically, the followable production for the individual well units will be established as follows:

(a) the total field allowable production will be prorated among the individual well units on the basis of the number of productive acres contained within each unt;

(b) the allowable so granted to a well subsequent to July 1, of any year, not produced during the month granted, can be carried forward as unproduced allowable or 'under-production' which can be produced at a later time; however, if this accumulated underproduction is not produced prior to July 1, of the next succeeding year, this allowable is cancelled and lost for all time; and

(c) if such cancellation takes place "it necessarily follows that reserves are lost through drainage, which may result in irreparable economic losses to both the operator and to the land owners."

(5) "According to information received by Tennessee" the combined minimum daily take or pay for volume under the Tidewater and Gulf contracts with United Gas Pipe Line Company will be approximately 94,000 Mcf per day "when all production facilities are tied in"; and United's maximum take rights will equal 141,000 Mcf per day;

(6) Applicant owns approximately 60 percent of the acreage (in all sands) of the production units established in the Bastian Bay Field and must, therefor, be in a position to take into its system volumes approximately 150,000 and 320,000 Mcf per day in order to be able to match United's minima and maxima (if United take these volumes) or else suffer the threat of severe drainage;

(7) Applicant has a substantial monetary stake in its Bastian Bay leases, as shown in the proceeding in Docket No. CU61–106, and its unit costs are inversely proportional to the rate of production;

(8) Moreover, Applicant experienced several emergencies on its system last winter; should similar weather conditions fecur in the future similar "emergencies could be substantially alleviated were Tennessee permitted to take greater volumes of gas from the Bastian Bay Field."

We have examined the Louisiana Department of Conservation's Statewide Order No. 29–F,[3] which governs proration of nonassociated gas reservoirs in that State. Order No. 29–F provides, among other things, that:

(1) Nominations for allowables shall be filed "on or before the fifth (5th) day of March, June, September, and December of each year" and allowables shall be issued for each quarter of the year;

(2) "No gas well shall be entitled to an allowable, nor shall any allowable be granted, until all necessary physical connections are made to permit full utilization of the allowable to be granted"; and

(3) Any underproduction of the allowables "remaining on the 1st day of July of any year shall be cancelled and shall not thereafter be made up."

[2] See Tidewater Oil Company, FPC Gas Rate Schedule No. 108; Gulf Oil Corporation, FPC Gas Rate Schedule No. 214.

[3] Issued November 8, 1955, amended effective July 1, 1959, reported in Byram, *Rules and Regulations of the Louisiana Conservation Commission Oil and Gas*, Section I, pp. 18-19; and also in 5 *Oil and Gas Reporter* 474-8.

In the hearings held May 7 and 8, 1962, in Docket No. CP61-106 Applicant's witnesses testified that United had been withdrawing roughly 12,000 Mcf per day from three reservoirs in the Bastian Bay Field into an intrastate system pending completion of its interstate facilities; that those intersate facilities had not yet been completed and put into operation but migh be by he later part of May; and that the Bastian Bay Feld allowables for the second quarter of 1962 amounted to about 16,000 Mcf per day for Applicant, 16,500 Mcf per day for Tidewater and Gulf (combined), and 13,000 Mcf per day for Phillips.

The hearings on the permanent certificate application in this proceeding (Docket No. G-16842) have concluded and briefing is in progress. In our view, however, we retain power under subsection 7(c) of the Natural Gas Act to revise our temporary certificate of August 30, 1961, without awaiting decision on the record in this proceeding and without prejudices to such decision in this or any other proceeding.

The Commission finds:

It is necessary and appropriate to amend the temporary authorization, issued August 30, 1961, as hereinafter provided, in order to assure maintenance of adequate service.

The Commission orders:

(A) The order of August 30, 1961, in this proceeding is hereby amended by deleting therefrom ordering paragraph (B) (2), without prejudice to the decision and determination of this or any other proceeding.

(B) Ordering paragraph (A) above shall become effective from and after July 1, 1962.

ALABAMA-TENNESSEE NATURAL GAS COMPANY, DOCKET NOS. G-5471, G-11982, G-17218 AND G-19984

OPINION AND ORDER MODIFYING AND ADOPTING INITIAL DECISION OF PRESIDING EXAMINER, DETERMINING JUST AND REASONABLE RATES, AND PROVIDING FOR REFUNDS

(Issued June 13, 1962)*

Syllabus

1. *Deferring* decision on use of liberalized depreciation in computation of Respondent's income taxes and accumulated taxes in determination of its rate of return, Commission *states* that any change in its policy with respect thereto will be applicable to rates here prescribed from and after date of such decision. P. 1182.
2. As long as rate ultimately arrived at by the Commission does not pierce contract ceiling, route by which Commission reaches its destination is matter wholly beyond legitimate scope of service agreement. P. 1184.
3. Deviation from letter of service agreement discussed; Commission *finds* that where such service agreements expressly contemplate *ex parte* filings, rights of customers will be generally safeguarded by order assuring refund at least as great as customer would have been entitled to had rate increase contemplated by contract not been exceeded. P. 1185.
4. Commission *finds* subparagraph 3(a) unreasonable, unduly discriminatory, etc. since it requires that increases in suppliers' demand charge, properly

*Designated Commission opinion No. 360. Initial decision appears on p. 1202. Order issued July 30, 1962, staying effectiveness of paragraphs (C) and (D), 28 FPC 242. Order issued August 3, 1962, granting in part and denying in part application for rehearing; modifying opinion and dissolving stay, 28 FPC 273.

classified as demand costs, be recovered by Respondent solely through increases in commodity charge; *orders* limitations expressed therein be deemed inoperative and of no effect. P. 1186.

5. Commission uses test year concept for determining just and reasonable rates for each of three locked-in periods; *rejects* Respondent's requested use of each and all five years embraced by such periods; uses test years 1958 and 1959, but employs two-year interval, 1955 and 1956, for first period. P. 1187.
6. Use of single 3-day peak period for each test year is fair, reasonable and conventional basis for testing system capacity during test period and for allocating demand costs between jurisdictional and nonjurisdictional customers. P. 1187.
7. In determining prospective rates it is generally desirable to use most recent period of actual experience for test years because such data tend to be more realistic and representative for the future. P. 1187.
8. Amounts for rates of return stated in rate increase filings place no limitation on rates of return permitted Respondent. P. 1188.
9. Rates of return determined here for jurisdictional business are deemed necessary if jurisdictional business is to provide its fair share of return to which company is entitled; but Commission need not close its eyes to beneficial effects of industrial sales on Company's economic strength in evaluating its ability to finance operations. P. 1189.
10. Commission *notes* that over-all rate of return here found just and reasonable would bring a return on common equity of approximately 9.50 percent for prospective period. P. 1190.
11. Commission *concludes* that 6½ percent is a fair and reasonable rate of return for all dockets. P. 1190.
12. Respondent allowed to recoup through G–5471 rates the portion of unamortized rate case expense allocable to jurisdictional sales. P. 1191.
13. Commission *disallows* claimed court costs which are not known or reasonably predictable, but are speculative; *allows* proper regulatory expense to be spread over 8-year period. P. 1191.
14. Since it is re-examining issue of income taxes, Commission follows previous policy of permitting company to include in cost of service taxes computed on basis of straight line depreciation, while paying taxes on basis of liberalized depreciation; any policy change would be applied only prospectively. P. 1191.
15. Commission *allows* depreciation rate of 3.2 percent; *rejects* Respondent's request for 3.5 percent, subject to refund pending supplier's similar request. P. 1192.
16. "Merit increases," occurring after test year for prospective period, *disallowed* in cost of service. P. 1193.
17. Commission *agrees* that no deduction for depreciation on rights-of-way should be considered in determining Federal income tax allowance. P. 1193.
18. Commission *disallows* proposed increased rates tendered by Respondent under Section 4 of the Natural Gas Act; determines just and reasonable rates, and provides for refunds. P. 1195.

Stanley M. Morley for Alabama-Tennessee Natural Gas Company.

Reuben Goldberg, *George Speigel*, and *William L. Sharp* for Tennessee Valley Municipal Gas Association.

Samuel B. Ross, *Louis C. Kaplan*, and *Harwood G. Martin* for the Staff of the Federal Power Commission.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

SWIDLER, *Chairman:*

This is a pipeline rate case, involving increased rates filed by Albama-Tennessee Natural Gas Company (Albama-Tennessee) under Section 4 of the Natural Gas Act (Act). The company has made four successive filings for increased rates, the first in 1954, and the most recent in 1959 which are the rates presently in effect. All four of the rate increases in question were suspended by the Commission, and thereafter were collected subject to refund. The case before us therefore involves three so-called locked-in periods in which the rate increase covers a definite period in the past and the most recent increase which covers rates for the future.

The hearing on all four rate increases began on July 13, 1960 and was concluded on October 25, 1960. The presiding examiner's initial decision was issued September 25, 1961, and is before us on exceptions filed by Alabama-Tennessee and an intervenor, the Tennesse Valley Municipal Gas Association (Association).[1] The examiner would disallow some $515,000 of the approximately $1,481,000 collected by Alabama-Tennessee during the three locked-in periods and make comparable reductions for the future. Association's position is that the company's revenues collected subject to refund are excessive by some $718,000 for the locked-in periods. Commission staff's position in its brief is that Alabama-Tennessee had collected revenues exceeding proper costs by some $539,000 for the locked-in periods.

The issues were carefully considered and fully discussed in the findings and conclusions contained in the examiner's decision, which we adopt with modifications where appropriate. In summary we conclude that the examiner should have allowed the company higher rates of return which, with other adjustments we find proper, will, for the most part, yield the company slightly higher rates than those the examiner found just and reasonable but lower than those the company requested.

The Commission on June 1, 1962, ordered further briefs and argument on the issues of the treatment to be accorded the use of liberalized depreciation in the computation of Alabama-Tennessee's income taxes and of accumulated taxes in the determination of its rate of return. We are accordingly deferring a decision on these two issues with respect to Alabama-Tennessee's rates for the future until after the argument. However, it is not in the public interest to delay our decision on all of the other issues in these four dockets which will result in immediate refunds and rate reductions.

It should be noted that in the refunds ordered herein and the rates prescribed, we have based our treatment of these two issues upon certain prior Commission rulings which we are now re-examining. We approve the instant determination for the past periods involved and the interim until we reach a decision in these issues after a further argument because any change in Commission policy would not be made retrospectively. Any change in Commission policy on these issues will be applicable to Alabama-Tennessee's rates herein prescribed from and after the date of such decision.

FACTUAL AND PROCEDURAL BACKGROUND

Alabama-Tennessee is a small interstate gas pipeline transmission company extending from western Tennessee a distance of some 140 miles to Huntsville

[1] The Association represents resale customers of Alabama-Tennessee consisting of the cities of Corinth and Iuka, Mississippi; and Tuscumbia, Sheffield, Florence, Russellville, Decatur, Athens, and Huntsville, Alabama.

Alabama. It purchases its entire gas supply from Tennessee Gas Transmission Company (TGT), and sells gas for resale to 14 communities of medium size and to direct industrial customers. It has a gross plant in service of approximately $5,000,000 and its gross revenues amount to about $6,000,000 annually.

Alabama-Tennessee's four proposed increased rates in the four dockets listed in the caption were filed, according to the statements in the company's rate filings, to recover increases in the rates of its supplier, TGT. The cumulative amounts of the proposed increases on an annual basis and the periods of time to which the proposed increased rates relate are as follows:

Docket No. G-5471	$74,000	12/15/54 to 7/13/57.
Docket No. G-11982	$258,000	7/14/57 to 5/14/59.
Docket No. G-17218	$385,000	5/15/59 to 4/4/60.
Docket No. G-19984	$901,000	4/5/60 prospectively

The Association's Motion To Dismiss

As a threshold matter, the Association excepts to the examiner's refusal to grant its motion to dismiss Alabama-Tennessee's rate filings claiming the filings were not authorized by the service agreements between Alabama-Tennessee and its wholesale customers and, under the Supreme Court's decision in *United Gas Pipe Line Co.* v. *Mobile Gas Service Corp.*, 350 U.S. 332, must therefore be treated as nullities.[2] The Association contends that Alabama-Tennessee's right to file for rate changes is subject to the specific conditions set forth in subparagraph (a) and (b) of Section 3. In the Association's view, Alabama-Tennessee failed to meet those conditions in that it presented evidence at the hearing with respect to cost of service factors other than those referred to in subparagraphs (a) and (b), and also in that its proposed increases were not confined solely to the commodity charge, as allegedly required by subparagraph (a).

---

[2] The pertinent provisions of Article V, Section 1, *et seq.*, of a typical service agreement, such as that applicable to sales to the Public Utilities Commission of the City of Corinth, Mississippi, provides as follows:

"1. The rates to be paid for natural gas delivered hereunder are subject to the jurisdiction of the Federal Power Commission and shall be those contained in Rate Schedule G-1 on file with the Federal Power Commission and lawfully in effect from time to time pursuant to the provisions of the Natural Gas Act.

"2. This agreement in all respects shall be and remain subject to the provisions of the applicable Rate Schedules and General Terms and Conditions attached to the rate schedules filed with the Federal Power Commission, all of which are by reference made a part hereof.

"3. Seller may file with the Federal Power Commission, or other body having jurisdiction, for a change in the rates and charges effective as to Buyer, in accordance with the following sub-paragraphs; provided, however, that should it hereafter become unnecessary for Seller so to file, Seller shall have the right to increase the rates and charges effective as to Buyer to provide that:

(a) One-half cent increase or decrease, as the case may be, *in the commodity charge* for *each full one-half cent* per Mcf that the *average cost* of gas purchased by Seller shall exceed or shall be less than the *average purchase price* paid by Seller for gas during the *calendar year of the effective date of the Rate Schedule* specified in Section 1 of this Article V. [Emphasis added in order to highlight the problematic features.]

(b) Adjustment of the commodity charge in an amount equal to the amount of any present or future sales tax levied by the United States or by the States of Alabama, Mississippi, or Tennessee, or any political subdivision thereof, on, or in respect of, applicable to, or measured by deliveries of natural gas hereunder to Buyer, if and to the extent any such sales tax shall be actually paid by Seller and in an amount equal to three-fourths of any additional tax, (as additional tax is defined in the next sentence hereof) which Seller shall be required to pay. * * *"

In most of the service agreements applicable to sales under rate schdule SG-1, the concluding phrase of subparagraph (a) is "during the calendar year 1949", instead of "during the calendar year of the effective date of the Rate Schedule specified in Section 1 of this Article V."

In reply, Alabama-Tennesseee urges, among other things, that its service agreements expressly permit it to file for rate increases reflecting increases in the rates of its supplier, TGT. It points out that each of its four rate filings was intended solely to pass on increased purchased gas costs, and that in each instance the increase in its demand or commodity charge was respective to an exactly equivalent increase in the demand or commodity charge of TGT. Alabama-Tennessee concludes that *Mobile* is inapplicable and that the issue is governed instead by the Supreme Court's later decision in the *Memphis* case, *United Gas Pipe Line Co.* v. *Memphis Light, Gas and Water Division*, 358 U.S. 103.

In denying the motion to dismiss, the examiner took the position that the provisions of Section 3 of the contract were not designed to limit the right to make *ex parte* filings, impliedly granted by Section 1, but were intended merely to establish an optional filing procedure, adherence to which would make it unnecessary for Alabama-Tennessee to file a full cost of service presentation. The examiner pointed out that the rate increases ultimately determined to be just and reasonable did not in fact exceed the increases in the average cost of purchased gas to Alabama-Tennessee.

Neither party offered for the record any explanation as to the reasons or surrounding circumstances which gave rise to the unusual requirements of subparagraph 3(a). Through an examination of the Commission's files, however, we have ascertained that Section 3 was a part of Alabama-Tennessee's initial form service agreement in 1949 and apparently was copied almost verbatim from the rate provisions of its then effective service agreement with TGT. The difficulties with which Section 3 bristles would appear to stem from the fact that a cost-reimbursement formula eminently appropriate in the case of a pipeline purchasing gas directly in the field became an anomaly when transplanted without significant modification to the service agreement of a secondary purchaser such as Alabama Tennessee.

Despite the indications that subparagraph 3(a) may have been the result of unimaginative draftsmanship rather than careful deliberation, the Commission is obliged to construe it consistently with its terms and in such a way as to give it a meaningful function when used incontext with other provisions of the contract. In so doing, we must disagree with the examiner's conclusion that the provisions of Section 3 should not be read as a limitation upon Section 1. Since Section 1, standing alone, would be deemed to endow Alabama-Tennessee with blanket authority to make *ex parte* filings, Section 3 would be reduced to surplusage unless construed as a qualification of that authority. The very least impact which must be ascribed to it is that filings which purport to be grounded solely on taxes or on increased purchased gas costs must conform to the specifications of the relevant subparagraph.

Alabama-Tennessee is alleged to have breached the service agreement in two ways: (a) by introducing at the hearing evidence with respect to cost of service items other than taxes and purchased gas costs; and (b) by filing proposed increases which deviated in certain respects from the formula contained in subparagraph 3(a). The first contention can be readily rejected. Section 3 imposes a ceiling upon the amount of the increase which the seller is authorized to propose, but places no limitation upon the cost of service data which it may adduce in support of that increase. Moreover, even if the contract had purported to impose such a limitation, it is clear that no agreement between the parties should be allowed to circumscribe the range of considerations which the Commission may, and indeed must, take into account in determining a just and reasonable rate. So long as the rate ultimately arrived at by the Commission does not pierce the contract ceiling, the route by which the Commission reaches

its destination is a matter wholly beyond the legitimate scope of the service agreement.

A more difficult question is whether the rate filings themselves were fatally defective and, if so, what consequences follow. Each of the four filings deviated in one or more respects from the formula prescribed in subparagraph 3(a). First, in Docket Nos. G–11982 and G–19984, increases in TGT's demand component were reflected by identical increases in Alabama-Tennessee's demand charge, rather than translated into "average cost" terms and added in that form to the commodity charge. Secondly, the proposed increases for the three locked-in periods duplicated each .1¢ increment, rather than merely each full one-half cent increment, in TGT's rate. Finally, in each filing the subtrahend utilized in computing the proposed increase was TGT's existing rate, rather than the "average purchase price paid by [Alabama-Tennessee] for gas during the calendar year" in which Alabama-Tennessee's existing rate schedule became effective.

In Docket Nos. G–5471, G–11982, and G–17218, the net effect of the above deviations was that the rate increases per Mcf of annual volume proposed by the applicant were actually less than those authorized by the subparagraph 3(a) formula. The only docket as to which the Association's *Mobile* argument has any real substance is Docket No. G–19984. In that docket the contractually authorized increases in the commodity charge was 6.5¢.[2] Alabama-Tennessee filed for an increase of 85¢ in its demand charge, which, for a customer having a 30% load factor (approximately the lowest load factor experienced by any of the company's G–1 customers), would be equivalent roughly to a 9.5¢ increase in the commodity charge. At 30% load factor, moreover, the increase we have determined to be just and reasonable, both for refund purposes and for the future, is more burdensome than the 6.5¢ commodity charge increase authorized by subparagraph 3(a). It is possible, therefore, that some of Alabama-Tennessee's customers may be prejudiced by its failure to adhere to the requirement that only the commodity charge be increased.

We do not believe, however, that this deviation from the letter of the agreement demands, or even justifies, the drastic relief requested by the Association, *i.e.*, dismissal of the filing and disallowance of all sums collected thereunder. It should be remembered that this is not a case like *Mobile* in which the contract, by providing for a fixed rate, impliedly ruled out any *ex parte* filings whatsoever. On the contrary, the instant service agreements expressly contemplate such filings, particularly for the purpose of passing on increased purchased gas costs. In these circumstances, the rights of the customers will be adequately safeguarded by an order which assures to each customer a refund at least as great as the refund to which it would have been entitled had the rate increase contemplated by the contract not been exceeded. Accordingly, we shall order that the amounts refunded to each customer in Docket No. G–19984 shall be the difference between the amounts collected subject to refund and the lesser of the following: (a) the amounts that would have been collected under the rates hereinafter found to be just and reasonable, or (b) the amounts that would have been collected had Alabama-Tennessee proposed and collected a commodity charge of 33.36¢ (representing 6.5¢ increase over the 26.86¢ charge

[2] This figure represents the margin (adjusted downward to the nearest ½ cent increment) between (a) 38.93¢, the average cost per Mcf of gas computed for the applicable test year (based on volumes for year ending 3/31/60 derived as follows: actual Mcf for calendar 1959 per FPC Form 2 minus actual Mcf for first quarter 1959 per application for increased rate plus estimated Mcf for first quarter 1960 per said application) at prices adjusted to reflect TGT's triggering rates; and (b) 32.24¢, the average cost, per FPC Form 2, for the calendar year 1959, the year in which the rates in Docket No. G–17218 became effective.

prescribed by the Commission in Docket No. G–17218) while holding its demand charge stable at 2.70 per Mcf.

As to the prospective period commencing with the effective date of this order, the Commission is neither required nor prepared to subordinate the rates it finds just and reasonable to the distorting demands of subparagraph 3(a). Section 5(a) of the Natural Gas Act, which applies to rates already in effect as opposed to rates subject to refund and awaiting Commission approval under Section 4(e), provides that whenever the Commission finds that a contract relating to rates, charges, or classifications is "unjust, unreasonable, unduly discriminatory, or preferential", it "shall determine the just and reasonable * * * contract to be thereafter observed and in force, and shall fix the same by order * * *". Section 4(e) of the Act authorizes the Commission, after a full hearing on a proposed rate change, to "make such orders with reference thereto as would be proper in a proceeding initiated after it had become effective [*i.e.*, a Section 5(a) proceeding]". Taken together, these two provisions empower us, upon making the requisite finding, to order appropriate modification of the discriminatory language of the service agreement.

We have no hesitation in finding that subparagraph 3(a) is unreasonable, unduly discriminatory, and preferential. In substance, it requires that increases in TGT's demand charge, which are properly classified as demand costs, nonetheless be recovered by Alabama-Tenessee from its customers solely through increases in its commodity charge. In other words, Section 3 systematically discriminate against high load factor customers by requiring them to bear a disproportionate share of the costs incurred by Alabama-Tennessee in maintaining its peak capacity. We shall therefore order that the limitations expressed in subparagraph 3(a) in the form of service agreement of the tariff and in the executed service agreements shall henceforth be deemed inoperative and of no effect. Alabama-Tennessee may submit for filing in accordance with the Regulations under the Natural Gas Act superseding service agreements which are appropriate in light of our order deleting subparagraph 3(a).

The Justness and Reasonableness of Alabama-Tennessee's Proposed Increased Rates

Test Years

The Locked-in Periods. Alabama-Tennessee contends in its exceptions that the examiner erred in his selection of the test years 1955, 1958, and 1959 for the locked-in periods (exceptions, p. 6, *et seq.*). The Company broadly contends that in view of the vagaries of weather and fluctuations in revenue and costs the only fair and equitable test is to compare the revenues and costs of service during the entire five-year period from 1954 through 1959.

We reject Alabama-Tennessee's requested use of each and all of the five years embraced by the three locked-in periods for determining the company's just and reasonable rates for those periods. We conclude that it is reasonable and appropriate in this case to follow the examiner's method, which has received judicial sanction, and use the test-year concept for each of the locked-in periods. See *Michigan Wisconsin Pipe Line Company*, 18 FPC 407, affirmed. *Michigan Wisconsin Pipe Line Company* v. *FPC* 263 F. 2d 553 (CA6, 1959). This method will tend to some extent to minimize possible distortions resulting from nontypical sales and revenues for the years and partial years covered by such locked-in periods.[4] The claim of abnormally cold weather, and the asserted

[4] The rates of return earned during each month of the company's operations vary depending on the seasonal requirements of its customers and the company cannot reasonably expect to recover the same return consistently every month in the year.

need for further adjustments have not been sufficiently supported to justify the adjustments claimed.

However, Alabama-Tennessee's contention that the examiner erred in selecting 1955 for the test period for the first locked-in period in Docket No. G–5471 has merit. It appears that this early year does not afford a representative period for testing the rates for the entire 31 months in question. In lieu thereof, we have employed a two-year interval, years 1955 and 1956 (Exh. No. 34) for determining just and reasonable rates for this 31-month period which in our judgment provides a realistic, normalized period for testing the rates for the first locked-in period. For the two remaining locked-in periods we find the test periods employed by the examiner, as herein adjusted, to be reasonable and appropriate.

We also reject Alabama-Tennessee's exception to the examiner's use of three-day peak periods within each of the test years for determining the company's cost of service, instead of the company's average of the three-day sustained peaks occurring during the winter season at the beginning and at the end of each calendar year (exceptions, p. 49, *et seq.*) The use of a single three-day peak period for each test year, in accordance with the examiner's decision, is a fair, reasonable and conventional basis for testing the capacity of the system during the test period and for allocating the demand costs between jurisdictional and nonjurisdictional customers.

The Prospective Period. In determining prospective rates, it is generally desirable, absent weighty countervailing considerations, to use the most recent period of actual experience for the test year, because such data tend to be more realistic and representative for the future. The examiner used the latest available 12-month period ending March 31, 1960 as his test year. Alabama-Tennessee argues for an earlier test year, as adjusted by the company for the abnormally cold weather which it contends occurred. The claim of abnormally cold weather is not sufficiently supported to justify a change from the latest available data and we shall therefore adopt the examiner's test year for the prospective period.

Rate of Return

The presiding examiner found that Alabama-Tennessee should be allowed a 6 percent rate of return for the first and second locked-in periods, a 6.25 percent rate of return for the third locked-in period, and a 6.4 percent rate of return for the prospective period.

The staff did not file exceptions to the examiner's rate of return allowances. However, in its brief it recommended a maximum over-all rate of return of 6.25 percent for all dockets and periods except the prospective period, and a 6.50 percent rate of return for the latter. The Association, likewise, did not except to the rates of return determined by the examiner. In its brief the Association recommended over-all rates of return of 6 percent for each of the years 1955 through 1958, 6.158 percent for 1959, and 6⅜ percent for the future.

Alabama-Tennessee in its exceptions contends that the examiner erred on the rate of return issue in two principal respects.

First, Alabama-Tennessee contends, in essence, that the examiner erred in limiting the rates of return for the company to those stated at the time of its four successive rate increase filings.[8] The company argues that it is entitled to the rates of return said to have been justified at the hearing, rather than

[8] The stated rates of return were 6 percent in the application in Docket No. G–5471; 6 percent in Docket No. G–11982; 6.25 percent in Docket No. G–17218; and 6.5 percent in Docket No. G–19984.

those requested in its filings.[6] Also, the company contends that the fact that it filed for reimbursement for increases in the price of gas purchased from TGT does not justify any limitation on its rates of return.

Second, Alabama-Tennessee contends that the law and evidence require that it be given no less than a 10 percent return on the equity component of its capital structure. It states that we have allowed this much or more in all our recent decisions, to pipelines larger and more diversified than Alabama-Tennessee, and with greater bargaining power in the money market.

As to Alabama-Tennessee's first contention, we agree with the company that the amounts for rates of return stated in its rate increase applications place no limitation on the rates of return permitted it even though they are indicative of the company's views on these issues at the time of the filing. The principles governing what rate of return shall be allowed a utility have been stated by the Supreme Court in the *Hope* case cited below, and have been applied in numerous Commission decisions. The rate of return must be measured by the company's financial needs—by such matters as the "return to the equity owner" which "should be commensurate with returns on investments in other enterprises having corresponding risks", the return necessary to "assure confidence in the financial integrity of the enterprise," and to enable it to "maintain its credit and attract capital," in the language of the Supreme Court.[7] These are matters to be established by factual proof and if the evidence shows the need, the required rate of return is not to be limited by formal or procedural considerations of the kind referred to above.

The determination whether a given rate of return satisfies the aforementioned standards of the *Hope* decision is of course a matter of judgment. In the exercise of that judgment we consider all the relevant factors in each particular case.

One important factor we have relied on in determining a company's financial needs in relation to those of other companies has been a comparison of the earnings-price ratios of the several companies.[8] Staff's Exhibit No. 32 affords a sound basis for evaluating earnings-price ratios.[9] It contains, among other data, the earnings-price ratios of ten principal natural-gas pipelines from 1950 through 1959; of 15 natural-gas pipelines staff considered most comparable to Alabama-Tennessee in size and otherwise, from 1953 through 1959; and of Alabama-Tennessee from 1951 through 1959. Of course, data for the individual companies vary considerably. However, using straight averages, and confining attention to data from 1953 through 1959 for the 15 more comparable companies, the following facts taken from Exhibit No. 32 clearly show that Alabama-Tennessee has progressed to an increasingly favorable position in the eyes of the investor compared to other natural-gas companies:

---

[6] As described in the examiner's decision, Alabama-Tennessee's evidentiary presentation was based on requested rates of return for the years and partial years embraced by each docket, varying from a low of 6.46 percent to a high of 7 percent for the prospective period.

[7] *FPC* v. *Hope Natural Gas Co.*, 320 U.S. 591, 603 (1944).

[8] See, *e.g.*, *Southern Natural Gas Company*, 24 FPC 26, 29 (1960). Alabama-Tennessee's capital ratios for the years 1955 through 1959, including 1959 as adjusted to reflect the inclusion of new 6 percent bonds at an estimated cost of 6.10 percent, have been on the order of 60 percent (including deferred taxes) and 40 percent equity (Exhibit No. 33).

[9] As testified by staff witness McGrath, the earnings-price ratio establishes a guide as to the value investors place on the earning ability of a company. The earnings-price ratio is computed by dividing the current market price per share into the latest 12-month's earnings publicly available at the date of the market price.

	Average earnings-price ratios, 15 selected pipeline companies (percent)	Average earnings-price ratios, Alabama-Tennessee (percent)
1953	8.1	12.1
1954	6.8	9.1
1955	6.2	8.6
1956	6.7	7.3
1957	7.7	7.4
1958	7.3	7.3
1959	6.9	5.9

Alabama-Tennessee's presentation tends to discount earnings-price ratio as a factor in determining the proper rate of return, and further contends, citing *Corporation Commission of the State of Kansas* v. *FPC*, 206 F. 2d 690, 721 (CA8, 1953), that we must, in determining rate of return, consider a number of facts beyond that of the return to the investor, including such matters as the age of the company, its financial outlets, whether it is expanding or consolidating its position, and the like. Thus the company contends that it has operated for only ten years and has no supporting connections with other companies. It argues that it is subject to abnormal risks because it has little diversity in loads and its sales are subject to wide fluctuations because of the relatively high proportion of industrial sales made to only three customers under contracts that are subject to termination or may expire. It contends that a large part of its resale sales are made in Huntsville, Alabama, at the end of its line, and that if the federal government's Redstone Arsenal operation is relocated, these will be subject to cutbacks.

The record in these proceedings discloses, contrary to Alabama-Tennessee's claim respecting its operations, age, and abnormal risk, that the company is in fact a successful, profitable and seasoned utility enterprise. It has a record of consistent growth since 1951, when it began its operations, both in jurisdictional and nonjurisdictional business. It serves an area with a remarkable growth record and every prospect for continued growth.

Two other matters relating to this issue should be mentioned. The staff in its brief refers to "special circumstances" concerning Alabama-Tennessee, described in testimony by Mr. B. F. Grizzle, President of Alabama-Tennessee, on cross-examination that the company on its entire operation realized earnings on equity consistently in excess of 20 percent in the years 1951 through 1959. Staff argues that such high rates of return are due in part to the company's relatively high volume of direct industrial sales and to economies in operations due to its ability to sell gas from various points on its system after relatively short hauls. We have no jurisdiction over direct industrial rates and our methods of cost allocation are designed to exclude the related costs in fixing jurisdictional rates. Moreover, the rates of return we determine here for the jurisdictional business are those we deem necessary if the jurisdictional business is to provide its fair share of the return to which the company is entitled. Nevertheless, we need not close our eyes to the beneficial effects of such sales on the company's economic strength in valuating its ability to finance its operations. See, *e.g.*, Matter of *Mississippi River Fuel Corp.*, 11 FPC 288, 299 (1952). Nor can we ignore the fact that the lower return on equity for the prospective period is due to the cost of the recent bond issue, a substantial portion of which is intended for non-jurisdictional business.

A further factor to be considered is that, under four separate docket numbers, Alabama-Tennessee has been collecting revenues subject to refund since late 1954. In effect, the consumers have been contributing equity money, which

presumably will be replaced in part with debt when refunds are made. We are not here making the formal adjustments to reflect the abnormal equity portion of the company but note that for the prospective period such an adjustment would bring the return on common equity up to approximately 9.50 percent on the basis of the over-all return found just and reasonable herein.

It would thus appear from Alabama-Tennessee's increasingly favorable position in the eyes of the investor, its ability to finance successfully, and its low risk position, and from other facts in the record, that a fair and reasonable rate of return for Alabama-Tennessee for all four of the dockets in issue, is 6½ percent. Such rates of return will provide Alabama-Tennessee with a return on equity of 10.16 for 1955, 9.86 for 1956, 9.74 for 1957, 9.86 for 1958, 9.59 for 1959, and 9.25 prospectively, on the capitalization for each of those years which includes the reserve for deferred taxes at 1.5 percent cost.

Classification and Allocation of Costs

Alabama-Tennessee excepted to the examiner's classification of the costs of fuel, supplies and maintenance relating to compressor station equipment wholly to commodity and also to the examiner's allocation of customer costs between jurisdictional and non-jurisdictional customers. We reject Alabama-Tennessee's exceptions for the reasons stated by the examiner.

Costs of Service for the Four Dockets

One of Alabama-Tennessee's basic objections to the examiner's decision is his claimed failure to find and disclose the source of the costs of service from which he obtained his proposed rates, or to relate the costs of service to the rates found proper (exceptions, p. 1, *et seq.*).

Analysis discloses that the examiner relied essentially on staff's costs of service for the locked-in periods, and on the Association's cost of service for the future. We have used basically the same costs of service relied on by the examiner, drawing from the parties' cost of service where appropriate to obtain additional data or make necessary adjustments. The costs of service and adjustments we find proper for each of the four periods will be discussed separately below, and are shown in Appendices A through D to this opinion.

Regulatory Commission Expenses (All Four Dockets). Alabama-Tennessee excepts to the examiner's treatment of two items of regulatory Commission expenses. In Docket No. G–5471, Alabama-Tennessee sought to charge in each of the years 1955, 1956, and 1957, one-third of certain regulatory Commission expenses aggregating some $36,000 said to have resulted from earlier rate proceedings but not recovered by the company as of December 31, 1954. As the examiner recognizes, the unamortized average balance of such expenses have normally been treated as a part of a company's net working capital requirement allowable as a part of the rate base (ex. dec., p. 1212). The amortization of the remaining balance of the expenses is made by a monthly charge to operating expenses, in this case apparently $1,000 per month. However, the examiner held, *inter alia*, that since Alabama-Tennessee's rate case preceding this case was a settlement,[10] it must be assumed that such settlement was a compromise by all interests.

We are unable to agree with the examiner. The cost of service approved in the settlement referred to above[11] specifically provided for recovery of about

[10] The order settling that case was issued March 18, 1954 in Docket Nos. G–2253, *et al.*, 13 FPC 899.

[11] Docket Nos. G–2253, G–2336, 13 FPC 899.

$52,750 of unamortized rate case expenses, dating back to 1952, over a three-year period ending February 28, 1957. (Exhibits 58 and 59, Docket No. G–5471, *et al.*). By December 31, 1954, after 10 months amortization, an amount of approximately $38,100 should have remained under the terms of the settlement cost of service. Alabama-Tennessee claims $36,000.[12] After consideration of the settlement cost of service terms and the company's claim, we are of the view that the company should be allowed to recoup through the G–5471 rates the portion of the $36,000 unamortized rate case expense allocable to jurisdictional sales.

The company estimates the entire regulatory cost of the present four case at $75,000. The examiner concluded that some $30,000 of this total consisted of anticipated costs to Alabama-Tennessee in event of court review, but that Alabama-Tennessee should be allowed only $15,000 of such court review costs since at least half of such costs would relate to the effect of the rates upon nonjurisdictional sales as well as being in large part for the benefit of the stockholders in Alabama-Tennessee (ex. dec., p. 1212). The examiner would spread the $60,000 he would allow over an eight-year period at $7,500 per annum, which would distribute such costs evenly through the years 1955 through 1962 inclusive.

Alabama-Tennessee contends that there is no justification for the examiner's disallowance of $15,000 of the anticipated court review expenses in Docket No. G–19984 because it would not affect the company's nonjurisdictional rates, and also because the very purpose of these proceedings is to determine the dollars to which the company and its stockholders are entitled. Further, says the company, the examiner's disposition of this issue is inconsistent with his treatment of pre-1955 expenses. The company does not object, however, to spreading the regulatory expenses of these procedings over eight years, as the examiner proposes.

The Association, in contrast, excepts to the examiner's allowance of any of the $30,000 court costs claimed by Alabama-Tennessee (exceptions, p. 5, *et seq.*). The Association argues that no litigation may result from the instant order and that in any event the company's customers should not be required to pay for the company's attempt to overturn the Commission's order.

We conclude that the examiner erred in allowing any of the $30,000 claimed court costs. Alabama-Tennessee's claimed $30,000 court costs are not known or reasonably predictable, but are, on the contrary, speculative. Further, if the company does later commence litigation, the costs thereof would probably fall outside the period we rely on here for testing the company's rates for the future. Finally, any such costs of litigation would normally be recovered by the company in future proceedings. Accordingly, the $60,000 of regulatory commission expense allowed by the examiner should be reduced by a further $15,000 to $45,000. In the circumstances of this case, spreading this $45,000 evenly over an eight-year period, as provided by the examiner and not excepted to by any party, is reasonable.

Income Taxes (All Four Dockets). The Association excepts to the examiner's allowing in Alabama-Tennessee's costs of service Federal income taxes in excess of the amounts currently payable (ex dec., p. 1223, *et seq.*). As the Association recognizes, the examiner followed our previous policy, detailed in Opinion No. 326, issued on August 10, 1959, in *El Paso Natural Gas Co.*, 22 FPC 260[13] and in subsequent cases of permitting a company to include in its cost

[12] $35,998.50 of which $806.50 is chargeable to Docket No. G–5471.

[13] Opinion No. 326 was remanded on grounds which did not affect the validity of our decision on the liberalized depreciation issue. See *El Paso Gas Co.* v. *FPC*, 281 F. 2d 567 (CA5, 1960).

of service taxes computed on the basis of straight line depreciation, while paying taxes on the basis of liberalized depreciation, as permitted by the liberalized depreciation provisions of Section 167 of the Internal Revenue Code.[14] The Association requests that we reverse our earlier decisions and accept its position (exceptions, p. 7, *et seq.*). As stated at the outset of this opinion we are re-examining this issue but the examiner's treatment will be used for the purposes of this determination because any change in policy would be applied only prospectively.

Alabama-Tennessee excepts to the examiner's supposed treatment of regulatory commission expense for tax purposes (exceptions, p. 41, *et seq.*). We have adjusted the costs of service to reflect an actual payment of $5,625 each year for expense incidental to regulation of these dockets; thus the amount shown in the costs of service and the amount allowed for tax purposes would be identical. The same reasoning and treatment have been applied to our allowance of $36,000 of unamortized regulatory expense. Any adjustment shown on Schedule M of the tax return is thus irrelevant to the tax computation based upon our costs of service. The other minor exceptions filed by the company respecting income tax matters are likewise irrelevant or immaterial in light of the actions we take in this opinion.

Depreciation Rate (Last Three Dockets). Alabama-Tennessee excepts to the examiner's use of a depreciation rate of 3.2 percent rather than the 3.5 percent rate commencing July 1, 1957, proposed by the company. To justify the higher depreciation rate, Alabama-Tennessee claims that such an increase would be in line with the depreciation rate based on a 24-year remaining life claimed by TGT, Alabama-Tennessee's sole supplier. Alabama-Tennessee further contends that its depreciation rate should be increased because of the risks of its enterprise and the investment yet to be recovered through accruals of the depreciation expense charge. Stating that the change was the considered decision of its Board of Directors, the company points out that a 3.5 percent rate is used by other pipelines with the Commission's acquiescence in numerous cases (exceptions, p. 38).[15]

The examiner found, *inter alia*, that there is no evidence that TGT will be unable to supply gas 24 years hence, and that Alabama-Tennessee may acquire another source of gas long before that time. The examiner was also of the view that the question of changing Alabama-Tennessee's depreciation rate is not ripe for determination until TGT's comparable request is decided (ex. dec., p. 1214, *et seq.*).

We conclude that the examiner's decision should be affirmed on this issue, basically for the reasons stated in his decision and summarized above. As to Alabama-Tennessee's request that it be permitted to increase its depreciation rate to 3.5 percent subject to refund, pending determination of TGT's similar request, we cannot conclude, in view of all the circumstances, that Alabama-Tennessee's depreciation rate should be fixed at whatever depreciation rate may be subsequently permitted TGT. Accordingly, the costs of service attached hereto will show depreciation expenses computed at the 3.2 percent rate herein found proper.

Expense for Alternate Source of Gas (Docket No. G–5471). Alabama-Tennessee excepts to the examiner's elimination from the rate base in Docket

[14] We have used only the taxes currently payable in computing a tax accrual adjustment to the working capital allowance in the rate base (*cf.*, examiner's decision, p. 1223).

[15] It cites, *e.g.*, *Mississippi River Fuel Corp.*, 4 FPC 340, 344 (1945); *Gulf Interstate Gas Co.*, 12 FPC 116, 126 (1953); and *El Paso Natural Gas Co.*, 22 FPC 260, 265 (1959).

No. G–5471 of expenditures totaling $11,344, made in an effort to obtain an alternate source of gas from Texas Eastern Transmission Company (Texas Eastern). We agree with the examiner's disallowance of this item. The expenditures were incurred several years prior to the earliest test year employed in these proceedings and are of a non-recurring nature. Nor is there any basis for capitalizing them, *i.e.*, including them in the rate base subject to amortization over a period of years, since the expenditures produced no asset of any kind.

Normalizing Adjustments (*Docket No. G–19984*). Alabama-Tennessee excepts to the examiner's disallowance of $12,267 in increased wages and salaries which occurred after the test year for the prospective period. The company contends that these so-called "merit increases" were known and certain and should be allowed under Commission precedents.[18]

The examiner, following staff's position, concluded that the very use of the term "merit increases" indicates that its purpose was to reimburse employees for increased efficiency, which has the effect of reducing unit costs of labor for Alabama-Tennessee. Thus, citing data adduced by the Association, the examiner found that on a unit of sales basis, operating labor costs decreased during the period 1954 through 1959 from 2.374 cents to 1.70 cents per Mcf of gas, amounting to a reduction of approximately 28 percent in the unit cost of labor (ex. dec., p. 1218).

Merit increases are designed to reduce costs, not to increase them and the evidence of the company's tread of a decreasing unit cost of labor bears this out. The company has not sustained its burden of proof to add this item to the test year cost of service. See *Mississippi River Fuel Corp., et al.*, 4 FPC 340, 346–347.

Exclusion of Depreciation on Rights-of-Way (*Docket No. G–11982*). The Association excepts to the examiner's ruling that no deduction for depreciation on rights-of-way should be considered in determining the Federal income tax allowance (exceptions, p. 6, *et seq.*). The Association contends that the company should have claimed a deduction of $14,016, based on the holding in *Northern Natural Gas Co.* v. *O'Malley*, 277 F. 2d 128 (CA8 1960), that a taxpayer may claim depreciation on rights-of-way.

We agree with the examiner on this issue primarily because we believe the company was justified in refusing to litigate the relatively small amount involved (ex. dec., p. 1218).

Rate Design

Alabama-Tennessee renders service to only three classes of customers. (1) Under Rate Schedule G–1 (General Service), firm service is available over its entire system under a two-part rate providing for a monthly demand charge, and a commodity charge. (2) Under Rate Schedule SG–1 (Small General Service), firm service is available over the entire system under a straight rate (per Mcf delivered) to small customers only. (3) Under Rate Schedule I–1 (Interruptible-Industrial Service), interruptible service for resale for industrial use only is available to certain customers under a straight rate, as specified in the rate schedules.

Formerly, Alabama-Tennessee rendered service under a fourth Rate Schedule TPS–G–1, but such service was terminated April 30, 1956.

In general, we agree with the examiner's decision respecting the design of

[18] The company cites among other decisions, *Hope Natural Gas Company*, 3 FPC 150, 183, and *El Paso Natural Gas Company*, 22 FPC 260, 263.

the rates for the above classes of service and specifically as to his finding that maintaining the 45 percent load factor for the SG–1 rate will best serve the interests of Alabama-Tennessee and the customers it serves (ex. dec., p. 1218, *et seq.*).

We also conclude that ideally the maintenance of a two-cent per Mcf differential between the I–1 rate, which is a straight rate, and the commodity component of the G–1 rate is reasonable and proper. However, it is not practicable to maintain this differential in the rates prescribed herein because to do so would require an increase in the company's I–1 rate.

Concerning the TPS–G–1 rate in Docket No. G–5471, this rate was in effect only a few months in 1956, and only 488 Mcf of gas were sold under it. The examiner held, and we agree, that no action with respect to this rate is warranted (ex. dec., p. 1222, *et seq.*).

Prescribed Rates and Refunds

The costs of service we find proper for Alabama-Tennessee for each of the locked-in periods and prospectively are set forth in Appendices A through D attached hereto. Based upon those costs of service we shall prescribe as the just and reasonable rates for Alabama-Tennessee in the respective dockets the rates shown in Appendix E which also contains the rates proposed by the company and by the examiner for comparison.

In Docket Nos. G–11982 and G–17218, Alabama-Tennessee's proposed increases were filed on the basis of proposed increases filed by TGT in the latter's Docket Nos. G–11980 and G–17166. In the event we find TGT's proposed increases in those dockets unjust and unreasonable and require refunds by TGT, Alabama-Tennessee should be required to submit a plan satisfactory to the Commission providing for refunds to its jurisdictional customers of the appropriate portion of the amounts, including interest, it receives from TGT. Under such plan, the refunds by Alabama-Tennessee of the jurisdictional portion of the amounts received from TGT shall first be made to the G–1 and SG–1 customers to provide as far as practicable the 2-cent differential hereinabove found desirable between the commodity component of the G–1 rate and the I–1 rate.

As set forth in the examiner's decision, Alabama-Tennessee's proposed increased rates in Docket No. G–19984 reflect exclusively in the demand component an increase by TGT in Docket No. G–19983 of 85 cents per Mcf of billing demand. In the above prescribed rates we permit recovery of TGT's contingent rate increase in the demand component of Alabama-Tennessee's cost of service pending decision in G–19983. The prescribed rates follow the classified costs obtained under the Seaboard formula, except for the differential between the firm G–1 commodity rate and the I–1 rate previously described.

Alabama-Tennessee's proposed increased G–1 and SG–1 rates in Docket No. G–19984 were allowed to become effective subject to refund on April 5, 1960. Such rates as noted are based on increased rates charged by TGT in Docket No. G–19983, subject to refund. By order issued in Docket No. G–19983 on August 9, 1960, 24 FPC 204, under our interim order procedure, we disallowed a portion of TGT's proposed increased rates and directed refunds of amounts there found excessive, which refunds are not reflected in the cost of service shown in Appendix D hereto. Accordingly, Alabama-Tennessee should be required to file revised tariff sheets containing the rates we herein find just and reasonable as reduced to reflect the reduction in TGT's rates filed in accordance with our August 9, 1960 order. Likewise, Alabama-Tennessee should be required to

refund to its customers the amounts collected on and after April 5, 1960, in excess of the rates contained in the revised tariff sheets herein required to be filed, as further subject to the refund requirements set forth *supra*, in our discussion of the Association's motion to dismiss, all as more fully prescribed in our order hereto.

Alabama-Tennessee also should be required to submit a plan satisfactory to the Commission providing for refund to its jurisdictional customers of the appropriate portion, including interest, of any further refunds that may be made by TGT to Alabama-Tennessee in Docket No. G–19983 for gas delivered on or after April 5, 1960, as provided hereinabove for Docket Nos. G–11982 and G–17218. Respecting such refunds from TGT, Alabama-Tennessee shall compute appropriate further reductions in its rates in Docket No. G–19984, in the same manner as TGT's rate reductions are made, and file revised tariff sheets satisfactory to the Commission reflecting such reductions in its rates, maintaining to the extent practicable the 2-cent differential herein found desirable between the commodity component of the G–1 rate and the I–1 rate, as set forth hereinabove.

The rates herein prescribed in Docket No. G–19984 are also subject to possible adjustment to reflect the Commission's decision on the issues of the treatment of liberalized depreciation and return on deferred taxes which are the subject of further argument as provided in the Commission's order of June 1, 1962 herein.

The Commission orders:

(A) The decision of the presiding examiner issued on September 25, 1961, as modified herein, is adopted by the Commission as its decision in these proceedings.

(B) The proposed increased G–1 and SG–1 rates tendered for filing by Alabama-Tennessee in the respective dockets, as contained in its First Revised Sheets Nos. 5 and 10, Third Revised Sheet No. 5 and Second Revised Sheet No. 10, Fourth Revised Sheet No. 5 and Fifth Revised Sheet No. 10 and Fifth Revised Sheet No. 5 and Sixth Revised Sheet No. 10 to its FPC Gas Tariff, First Revised Volume No. 1 are unjust, unreasonable, unduly discriminatory and preferential or otherwise unlawful and are hereby disallowed.

(C) Alabama-Tennessee, within 45 days from the date of issuance of this order, shall file substitute tariff sheets, subject to approval of the Commission, containing the rates and charges set forth in the rate table in Appendix E, under the heading "Prescribed Rates" in Docket Nos. G–5471, G–11982, and G–17218. In Docket No. G–19984, Alabama-Tennessee shall file the rates and charges set forth under the heading "Prescribed Rates", but reduced to reflect the decrease in TGT's rates which were filed in accordance with our August 9, 1960 interim order.

(D) Alabama-Tennessee, within 45 days from the date of issuance of this order, shall refund to its customers for the respective period covered by each docket, the difference between the amounts collected in Docket Nos. G–5471, G–11982, and G–17218, under the increased rates tendered for filing in those dockets and the amounts that would have been collected in those periods under the "Prescribed Rates", to be filed under Paragraph (C) above, plus interest at the rate of 6 percent per annum from the date of payment to Alabama-Tennessee to th[illegible]ess amounts so determined. In Docket No. G–[illegible]17 Tax currently payable—note 1.] [illegible]mer, plus interest at the rate of 7 percent per annum shall be the differe[illegible]between the amounts collected in such docket and the lesser of the followin[illegible] (a) the amounts that would have been collected

under the rates filed in said docket pursuant to Paragraph (C) above, or (b) the amounts that would have been collected had Alabama-Tennessee proposed and collected a commodity charge of 26.86 cents per Mcf plus the average increase in cents per Mcf contemplated by Article V, Section 1, subparagraph 3(a) of its executed service agreements.

(E) Alabama-Tennessee shall submit a plan of refund to its customers, subject to the approval by the Commission, of the proportionate amount of any refunds, including interest it may receive from its supplier, Tennessee Gas Transmission Company, as a result of Commission determinations in Docket Nos. G–19980, G–17166, and G–19983 within 30 days from the date of receipt of such refunds by Alabama-Tennessee. The refunds to be so made are to be apportioned in the manner in which they are received from TGT; *i.e.*, in the demand or commodity components of the cost of service or in both if so received from TGT, and maintaining as near as practicable the 2-cent differential between the commodity component of the G–1 rate and the I–1 rate, as hereinbefore described.

(F) The rates filed in Docket No. G–19984 pursuant to paragraph (C) above shall be reduced to reflect any decrease in rates which TGT may be required to make by final Commission order in Docket No. G–19983 on a prospective basis subsequent to the end of the period for which refunds are made by TGT. Such rates shall also be subject to such appropriate further adjustment as may be required by the Commission's decision on further argument and briefs as provided by the order issued herein on June 1, 1962, but only from and after the date of such decision or a later date if specified by the Commission therein.

(G) Within 15 days after making of any refunds as provided herein, Alabama-Tennessee shall report to the Commission in writing and under oath the amount of refund made to each of its customers, showing separately the amount of principal and interest so paid and the billing determinants or other bases used for such determinations and shall serve a copy of such report upon each of the customers receiving a refund. Concurrently therewith, Alabama-Tennessee shall file with respect to such refunds, releases from its jurisdictional customers showing receipt of the principal and interest in conformity with this opinion and order.

(H) The limitations expressed in Article V, Section 1, subparagraph 3(a) of the form of service agreement contained in Alabama-Tennessee's FPC Gas Tariff, and in the executed service agreements thereunder, shall henceforth be deemed inoperative and of no effect. Alabama-Tennessee may submit for filing in accordance with the Regulations under the Natural Gas Act superseding service agreements which are appropriate in light of our order making inoperative the aforementioned subparagraph 3(a).

(I) The motion of the Tennessee Valley Municipal Gas Association to dismiss the proposed increased rates tendered for filing by Alabama-Tennessee in these proceedings hereby is denied.

(J) Exceptions not granted herein are hereby denied.

DECISION

UPON APPLICATIONS FOR INCREASED RATES

(Issued September 25, 1961)

LAW, *Presiding Examiner:* On June 3, 1948, a decision was issued in the *Matter of Alabama-Tennessee Natural Gas Company* (Alabama-Tennessee), Docket No. G–585, authorizing the original construction of a pipeline system subject to the jurisdiction of this Commission, by a Hearing Examiner of this Commission. On July 2, 1948, thereafter the Commission adopted the said decision as its order with two modifications, one of which required the filing of a satisfactory tariff at least six months prior to the commencement of operations and the other of which required the beginning of construction within one year from the date of issuance of the Commission's order of July 2, 1948 [7 FPC 251].

Alabama-Tennessee thereafter constructed its interstate pipeline system in the manner authorized or as subsequently modified by virtue of later orders of this Commission. Alabama-Tennessee also filed its proposed tariff sheets as required by the Commission order of July 2, 1948. Such proposed tariff sheets of Alabama-Tennessee together with changes and modifications subsequently approved by this Commission constituted the tariff of Alabama-Tennessee which was effective on November 5, 1954.

On November 5, 1954, Alabama-Tennessee, pursuant to Section 4 of the Natural Gas Act and the Commissioner's General Rules and Regulations, particularly Part 154 thereof (CFR 18, Part 154), tendered for filing First Revised Sheets Nos. 5 and 10 to its FPC Gas Tariff, First Revised Volume No. 1. The tariff changes contained in the tendered filing, which were proposed to be made effective November 3, 1954, embodied a proposed annual rate increase estimated at $74,175, to compensate Alabama-Tennessee for an increase in cost of gas resulting from an increase proposed by its sole supplier, Tennessee Gas Transmission Company (Tennessee).

By order issued December 2, 1954, this Commission provided that, pending a hearing and decision thereon, the proposed rate and charges contained in the revised tariff sheet tendered for filing on November 5, 1954, should be suspended until December 15, 1954, and until such further time thereafter as they may be made effective in the manner prescribed by the Natural Gas Act. Notice was given to interested state commissions and others.

On January 7, 1955, the Commission authorized the tariff sheets tendered for filing on November 5, 1954, to become effective as of December 15, 1954, upon the filing by Alabama-Tennessee of a corporate undertaking to make such refunds to customers as the Commission might thereafter order upon such undertaking, together with 6 percent interest upon the amounts ordered refunded from the date of their collection and all costs of such refunding.

Subsequently on December 29, 1955, Alabama-Tennessee tendered for filing certain original sheets constituting Rate Schedule TPS–G–1 to its FPC Gas Tariff, First Revised Volume No. 1 providing for temporary firm peak service. By an order adopted January 25, 1956, and issued February 6, 1956, the Commission provided that the proposed TPS–G–1 rates of Alabama-Tennessee should become effective as of December 29, 1955, subject to the terms and conditions of the Commission's order issued January 7, 1955, in Docket No. G–5471, and subject to the terms and conditions of the corporate undertaking of Alabama-Tennessee filed pursuant to such order.

On January 14, 1957, Alabama-Tennessee submitted for filing Third Revised Sheet No. 5, and Second Revised Sheet No. 10 to its FPC Gas Tariff, First

Revised Volume No. 1, proposing increases in rates and charges expected to total approximately $184,000 per annum, based on estimated sales for the 12-month period ending July 31, 1957. Such proposed increases are in addition to the rates in effect subject to refund in Docket No. G–5471. Alabama-Tennessee alleged that the proposed increases are for the sole purpose of passing on to its wholesale customers their proportional part of the proposed rate increases tendered for filing by Tennessee on the same date (Docket No. G-11980), and required that its proposed filing be made effective on the date that Tennessee's proposed increases were permitted to become effective. Alabama-Tennessee proposed increases in its G–1 Schedule identical with those proposed by Tennessee. The proposed increase in the SG–1 rate schedule assumes a 30% load factor, based on experience.

On February 13, 1957, the Commission suspended the proposed rate increases of Alabama-Tennessee, proposed on January 14, 1957, until July 14, 1957, the same date on which Tennessee's proposed rate increase became effective and assigned Docket No. G–11982 to the proceedings thereon. The order in Docket No. G–11982 provided for a formal hearing upon the proposed increases, to be held at an undetermined future date. On July 18, 1957, the Commission issued a further order in Docket No. G–11982, providing that the increases proposed by Alabama-Tennessee, to which said docket number had been assigned, might become effective as of July 14, 1957, upon the filing within 15 days from the date of said order of a corporate undertaking by Alabama-Tennessee to make such refunds to all customers as the Commission might thereafter order, after hearing in the said matter.

On November 14, 1958, Alabama-Tennessee tendered for filing its Fourth Revised Sheet No. 5 (superseding Third Revised Sheet No. 5), Fifth Revised Sheet No. 10 (superseding Fourth Revised Sheet No. 10), and First Revised Sheet No. 11–D (superseding Original Sheet No. 11–D) to its FPC Gas Tariff, First Revised Volume No. 1. The changed sheets propose an annual increase in its rates and charges of $134,683 based on sales for the 12-month period ending September 30, 1958. Alabama-Tennessee stated that the proposed increases reflected only the impact of rate increases filed on the same date by its supplier, (Tennessee) and submitted a cost of service study, adjusted to show the increases in cost of purchased gas.

By an order of the Commission, issued December 12, 1958, in Docket No. G–17218, Alabama-Tennessee's First Revised Sheet No. 11–D to its FPC Gas Tariff, First Revised Volume No. 1, was permitted to become effective on December 15, 1958 and the other two proposed Revised Sheets were suspended and the use thereof deferred until May 15, 1959, being the same date on which the effectiveness of Tennessee's proposed rate increase was permitted. The said order also provided for a hearing at a date to be thereafter determined.

On December 22, 1958, Alabama- Tennessee filed a motion requesting that the Commission postpone the effective date of its First Revised Sheet No. 11–D to its FPC Gas Tariff, First Revised Volume No. 1, from December 15, 1958 to May 15, 1959. Alabama-Tennessee stated that such tariff sheet pertains to the sale of natural gas for resale for industrial use only and that it did not desire to collect an increased rate for such industrial gas prior to May 15, 1959, when Tennessee's increased rates may become effective in Docket No. G–17166. The Commission, by order issued on February 2, 1959, allowed the said First Revised Sheet No. 11–D of Alabama-Tennessee's to its FPC Gas Tariff, First Revised Volume No. 1 to become effective as of May 15, 1959.

On April 20, 1959, Alabama-Tennessee filed a motion requesting that the proposed revised tariff changes proposed in Docket No. G–17218 be made effective as of May 15, 1959. By order issued June 11, 1959, and amended by a further

order issued July 17, 1959, the Commission provided that the said Alabama-Tennessee proposed Fourth Revised Sheet No. 5, Fifth Revised Sheet No. 10, and First Revised Sheet No. 11–D to its First Revised Volume Sheet No. 1, should be effective as of May 15, 1959, upon the filing by Alabama-Tennessee of a corporate undertaking to make such refunds as the Commission might thereafter order in relation to the said Revised Sheets Nos. 5 and 10. The amended order of July 17, 1959 omitted First Revised Sheet No. 11–D from the requirement for the filing of a corporate undertaking, in view of the fact that the said First Revised Sheet No. 11–D related only to gas sold for resale for industrial purposes.

On October 5, 1959, Alabama-Tennessee tendered for filing Fifth Revised Sheet No. 5 and Sixth Revised Sheet No. 10, to its FPC Gas Tariff, First Revised Volume No. 1, proposing an annual increase in its rates and charges for jurisdictional sales of $515,941, based on sales for the year ending March 31, 1959. The proposed increase is based upon the rate-increase application filed by Tennessee, according to the rate-increasing application of Alabama-Tennessee.

By order, issued November 4, 1959, in Docket No. G–19984, the Commission suspended the said proposed Tariff Sheets, filed October 5, 1959, until April 5, 1960, and provided for a public hearing in regard thereto. On March 31, 1960, Alabama-Tennessee filed a motion requesting that the said proposed tariff sheets be made effective as of April 5, 1960. On May 20, 1960, the Commission issued an order making effective the proposed tariff changes requested in Docket No. G–19984 as of April 5, 1960, upon the execution and filing of a corporate undertaking within 15 days thereafter to make any refunds that might be directed thereafter by the Commission after a public hearing.

The corporate undertakings heretofore referred to in relation to proposed tariff sheets filed in Docket Nos. G–5471, G–11982, G–17218, and G–19984, have been duly filed. All of the proposed increased rates her under consideration are now being collected under them by Alabama-Tennessee.

On November 25, 1957, Tennessee Valley Municipal Gas Association (hereafter referred to as Municipal Association), filed a petition to intervene in Docket No. G–11982. The said Municipal Association described itself as an unincorporated association of municipally owned and operated gas distribution systems which are customers of Alabama-Tennessee. Subsequently the City of Corinth, Mississippi, the City of Florence, Alabama, the City of Tuscumbia, Alabama, and the City of Athens, Alabama, filed petitions to intervene in Docket Nos. G–5471, and G–11982. The cities of Corinth, Florence ,and Tuscumbia also filed petitions to intervene in Docket Nos. G–17218 and G–19984. In addition, the Town of Iuka, Mississippi, the Town of Selmer, Tennessee, and the City of Russellville, Alabama, filed petitions to intervene in Docket No. G–17218.

The Municipal Association filed a petition to intervene on November 25, 1957, in Docket No. G–5471, on April 27, 1959, in Docket No. G–17218, and on November 20, 1959, in Docket No. G–19984. In these petitions, the Municipal Association alleged itself to be an unincorporated association of municipally owned and operated gas distribution system, including the municipalities above named. In order to avoid duplication of effort in the hearing and to reduce the participants, the Commission denied intervention of the various municipalities and authorized the intervention of Municipal Association in Docket Nos. G–5471, G–11982, G–17218 and G–19984.

On May 19, 1960, the Commission issued an order consolidating these four proceedings and fixing July 12, 1960, as the date for the commencing of the

hearing thereon. By subsequent notice dated July 5, 1960, the date was postponed one day until July 13, 1960.

The hearing began on July 13, 1960 and continued through Friday, July 15, when a recess was taken until July 27, 1960. The hearing was reconvened on Wednesday, July 27, 1960 and continued through Saturday, July 30, when a recess was taken to Wednesday, October 19, 1960, in order to permit preparation of the direct cases of the Commission Staff and the intervener (Municipal Association).

The hearing reconvened on October 19, 1960 and continued through Tuesday October 25, 1960, when it was concluded. The original briefing schedule set by the Presiding Examiner at the close of the hearing provided for Alabama-Tennessee's main brief to be filed December 7, the brief of the Commission Staff to be filed December 28, the brief of Municipal Association to be filed January 5, 1961, and the final reply brief of Alabama-Tennessee to be filed January 19, 1961. At the request of Alabama-Tennessee the dates for briefs were later extended to December 21, 1960, January 17, 1961, January 26, 1961 and February 9, 1961, respectively. On January 23, 1961, counsel for the Municipal Association requested a further extension of briefing time from January 26, 1951 to February 16, 1961, and an extension of the time for the final brief of Alabama-Tennessee to March 9, 1961. This request of the Municipal Association was granted.

Subsequent to the filing of the final brief of Alabama-Tennessee on March 9, 1961, Municipal Association filed a motion for leave to file a supplemental brief, a copy of said brief being attached to the said motion. On April 3, 1961, Alabama-Tennessee transmitted to the Presiding Examiner a letter stating that it had no objection to the supplemental brief and commenting thereon. The said letter has been treated by the Presiding Examiner as a supplemental and final brief of Alabama-Tennessee, submitted in accordance with the procedural right of the party having the burden of proof in these consolidated proceedings to submit the last brief or substitute therefor.

The Interveners Motion to Dismiss

After the G–11982 rate was made effective under corporate undertaking in accordance with a Commission order of July 18, 1957, the City of Corinth attempted on August 19th to file an application for rehearing on the ground that the Commission had no jurisdiction to accept for filing the proposed rate increase. The application was rejected and the City of Corinth subsequently appealed to the United States Circuit Court of Appeals for the Fifth Circuit from the Commission's action in placing the increased rates in effect subject to refund. Corinth there asserted that it had a fixed price contract, and increases could not be authorized by the Commission.

The said Circuit Court of Appeals on June 29, 1959, held that the order from which the appeal was taken by the City of Corinth was interlocutory, procedural and ministerial, and did not go into the merits of the proceeding. The case is reported in 258 Fed. 2nd at page 10. Certiorari was refused by the Supreme Court on November 23, 1959, at 361 U.S. 900.

Early in the course of the hearing, Municipal Association moved to dismiss the four rate filings of Alabama-Tennessee here under consideration, upon the grounds that such filings were not authorized by terms of the contract between Alabama-Tennessee and the various distributors who are members of the said Municipal Association and represented thereby. The Presiding Examiner held that this motion should be considered only in connection with the determination contained in the initial decision.

Municipal Association argues that the Mobile case bars consideration of the present applications and that the exception to the Mobile case [1] created by the Memphis case decision [2] does not apply here. The argument of the Municipal Association is based on the fact that the question of price and rate schedules is discussed in two sections of the service agreement. The first of these provides that the rates to be paid for natural gas delivered thereunder is subject to the jurisdiction of the Federal Power Commission and are to be subject to the rate schedules on file with the Federal Power Commission and in effect from *time to time* pursuant to the provision of the Natural Gas Act. Undoubtedly, the first section standing alone would bring Alabama-Tennessee within the provisions of the exceptions stated in the Memphis case.

The Municipal Association's argument is that Section 3 of the same Article V relating to "Price and Rate Schedules" contains a subdivision which provided for the filing of an increase when there is an increase in the cost of purchased gas to Alabama-Tennessee justifying such increase but limits the rights of Alabama-Tennessee by requiring that the increase be requested only in the commodity charge. Another subdivision of Section 3 provides for an increase when the costs of Alabama-Tennessee are effected by changes in certain specified taxes. The tax question does not arise in the present group of proceedings. The provision in regard to increased cost resulting from higher costs of purchased gas reads:

> One-half cent increase or decrease, as the case may be in the commodity charge for each full one-half cent per Mcf that the average cost of gas purchased by Seller shall exceed or shall be less than the average purchase price paid by Seller for gas during the calendar year of the effective date of the Rate Schedule specified in Section I of this Article V *

It is not believed that the provisions of Section 3 of Article V, as this section appears in various service agreements filed under the G–1 and SG–1 rate schedules of Alabama-Tennessee, is intended to limit any of the rights of Alabama-Tennessee, as fixed by Sections 1 and 2 of the said Article. It is apparent that the provisions in regard to taxes and to increases in the "average" cost per Mcf of gas purchased by Alabama-Tennessee are intended to simplify the filing of rates increases in which the proposed increase is directly related to tax changes or to a change in the average cost of gas purchased by Alabama-Tennessee. To some extent, these provisions of the service agreement may (subject to Commission approval) simplify granting of increases, based upon either of the two reasons set forth in Section 3 of Article V by making it unnecessary for Alabama-Tennesse to present a full cost of service in justification of such an increase in rate.

Alabama-Tennessee's type of service agreement may also serve to facilitate agreements upon proposed increases or decreases, where no question appears other than those related to the increased cost of gas as a commodity or to a change in the tax or taxes referred to in subsection 3(b). The original form of the various applications for increase, which have been consolidated for hearing and are under consideration here, states that the proposed increases were to be based entirely upon increased cost of gas, as a commodity, to Alabama-Tennessee. When Alabama-Tennessee's evidence was presented, there were some other additional costs included, which did not represent cost of gas

[2] *United Gas Pipe Line Company* v. *Memphis Light, Gas and Water Division*, 358 U.S. 103.

* In some service agreements, the final clause of subsection 3 (a) Article V reads "during the calendar year 1949".

to Alabama-Tennessee. These additions have been considered in the present proceeding. The rates which are hereafter developed for determining of refunds by Alabama-Tennessee to its jurisdictional customers for the periods covered by Docket Nos. G–5471, G–11982 and G–17218 do not in fact place upon Alabama-Tennessee's customers any additional burden of cost arising from any source other than increased rates which Alabama-Tennessee pays to Tennessee as increased average cost of gas as commodity. The same situation exists in regard to the rates developed in Docket No. G–19984, applicable to determination of both refunds and future payments.

The record does not indicate whether the provision of Section 3 of Article V of any service agreement originated prior to the agreement made in the consolidated proceedings in Docket Nos. G–2253 and G–2336 between Alabama-Tennessee and its customers, which the Commission ruled upon and approved March 18, 1954. If such a provision were contained in previous service agreements, their waiver at that time (if not accompanied by a specific reservation) would, it is believed establish a precedent and cut off any right which might otherwise exist by reason of the Mobile case, heretofore referred to. In this case, however, it is not believed the question of waiver is material since, under any circumstances, the average increased cost passed on, in each case, to the customers of Alabama-Tennessee is less than the average increased cost, per Mcf of natural gas, to Alabama-Tennessee.

Upon consideration of the motion by Municipal Association to dismiss the several rate increase applications of Alabama-Tennessee under consideration in these consolidated proceedings, it has been determined that the Municipal Association has not established any justification for granting of its motion. Accordingly, the said motion is hereinafter denied.

Rate of Return

In its application for a rate increase in Docket No. G–5471, filed November 5, 1954, Alabama-Tennessee asked only for a 6% rate of return. Subsequently when the case came to hearing Alabama-Tennessee presented exhibits asking for a rate of return of 6.46% for the year 1955, 6.59% for 1956 and 6.69% for the portion of the year 1957 which would be included in the locked-in period, as to which the proper rate is to be determined in Docket No. G–5471. In relation to Docket No. G–5471 the Staff proposed a rate of return of 6.25%. Intervener Municipal Association prepared their exhibits on the basis of a 6% return during the period for which rates are to be determined by the action taken in Docket No. G–5471. We will hereafter discuss the breakdown of the rates into yearly segments proposed by Alabama-Tennessee and the Staff. For the present it is sufficient to say that we find no sound justification for granting to Alabama-Tennessee a return higher than the 6% rate of return claimed by that company in its application in the said Docket No. G–5471.

In its application for a rate increase in Docket No. G–11982, filed January 14, 1957, and suspended by Commission action to July 14, of that year, Alabama-Tennessee again asked only for allowance of a 6% rate of return. In its exhibits presented during the hearing, Alabama-Tennessee sought a 6.69% rate of return for the portion of the year 1957 (for which a rate of return is to be determined in Docket No. G–11982) as well as a rate of return of 6.68% for 1958 and a 6.83% return for the portion of the year 1959 included within the locked-in period covered by Docket No. G–11982. The Staff of the Commission recommends an allowance of a 6.25% rate of return for the period for which rates are to be determined in Docket No. G–11982. The Intervener Municipal Association insists that Alabama-Tennessee was only entitled to a 6% rate of return during the period in question in Docket No. G–11982. While the

evidence indicated that a slightly higher rate (6.10% and 6.15%) might be justified by the higher cost of money which was actually experienced during the period covered in Docket No. G–11982, it would appear that a dangerous precedent might well be created by dealing with rate proposals on the basis of intervening historical experience rather than on the basis of the knowledge of the applicant and others, as such knowledge existed at the time of the filing of the application for a rate increase. For that reason, we are, in the present decision, finding the rate of return to be allowed Alabama-Tennessee for the period from July 14, 1957, when the rate sought in the application in Docket No. G–11982 became applicable under bond, and May 14, 1959, when a further increase in rate became effective under bond in Docket No. G–17218, should not exceed 6% which Alabama-Tennessee asked for in its application filed January 14, 1957 in Docket No. G–11982.

In the application filed November 14, 1958, in Docket No. G–17218 by Alabama-Tennessee for a rate increase, which said rate increase became effective under a corporate undertaking to refund excess rates as of May 19, 1959, Alabama-Tennessee asked for a rate of return of 6.25%. Alabama-Tennessee subsequently presented evidence in this proceeding claiming a rate of 6.83% for the portion of the year 1959 for which Docket No. G–17218 rates might be effective and a return of 7% for the portion of 1960 prior to April 5, 1960 when the rates suspended in Docket No. G–19984 became effective under a similar corporate undertaking. Both the Staff and the Intervener Municipal Association presented their evidence as to the portion of 1959 to which Docket No. G–17218 rates would be applicable on the basis of a 6.25% rate of return. The intervener also presented evidence as to the actual cost of service and cost allocation for the period from January 1, through March 31, 1960 on the basis of a 6.25% return. In this case (Docket No. G–17218) it appears that Alabama-Tennessee should also be limited to the 6.25% return sought in its application.

In the application in Docket No. G–19984, filed October 5, 1959, and subsequently made effective under a corporate undertaking as of April 5, 1960, Alabama-Tennessee sought a rate of return of 6.5%. The latest figures presented by Alabama-Tennessee on a prospective basis cover the 13-month period ending December 31, 1959, and claim a 7% return. A cost of service study, made on a prospective basis for the calendar year 1959 by Staff, provided for a 6.5% rate of return. This is the only cost of service study presented by the Staff which can be utilized for determining the action to be taken in regard to the rate increase application designated as Docket No. G–19984. The Staff recommends the 6.5% return utilized in their 1959 prospective-basis study as the rate to be made applicable to the period covered by the G–19984 rate, effective April 5, 1960.

The Municipal Association, in its cost of service exhibit on a prospective-basis for the 12-month period ending March 31, 1960, provided for a 6.375% rate of return. In order to do this the witness adjusted the prospective costs to show payment to Tennessee at the increased rates of Tennessee, collection of which, subject to possible refunding if found to be excessive in the pending proceedings in Docket No. G–19983, were made effective as of the same date when Alabama-Tennessee's rates became effective under a similar undertaking to refund any part of the increase subsequently found (in the proceeding in Docket No. G–19984) to be excessive.

The witness O'Neil in his testimony on behalf of Alabama-Tennessee and the brief of that company both claim support for the reasonableness of the 6.5% rate of return sought by Alabama-Tennessee in Docket No. G–19984 on the basis of the existence of securities issued by Alabama-Tennessee at 6% interest

and upon the company's claim to be entitled to a rate of return which will amount to 10% on the common stock equity. Witnesses presented by Staff Counsel and Municipal Association do not concede the justice of the company's claim to expect this rate of return upon the common stock, either as a matter of Commission policy or as a necessary basis for possible future attraction of equity capital.

While there is some indication that, because of its size, Alabama-Tennessee may be in less favorable bargaining position than larger companies, better known to the average buyer of bonds because of their more widely diversified operations and the fact that they are known to transport gas, which is ultimately distributed within those large cities where a large portion of the available investment funds of individuals and of corporations such as insurance companies, who are large buyers of pipeline bonds, are generally found. To what extent the apparent high cost of this money to Alabama-Tennessee results from its comparative small service area which covers parts of Alabama, Mississippi and Tennessee with but one resale customer listed in the last of these states, and to what extent this apparent high cost may result from the rather high percnetage of direct industrial business, can not be determined with certainty.

On the basis of Alabama-Tennessee's own allocation of the overall cost of service for the 12-month period ending December 31, 1959, less than 54% of the total gas sold was sold and delivered to jurisdictional customers and, on the basis of the double three-day peak demand[2] utilized by Alabama-Tennessee, less than 76% of the peak-demand gas went to jurisdictional customers on those days.

In Mr. O'Neil's exhibit No. 2, he lists the overall rate of return indicated to be anticipated or stated to be reasonable, in various Commission opinions or orders issued during the period from 1952 to 1960. The only one listed for the 1960 period is the decision in the Matters of Manufacturers Light and Heat Company, issued February 25, 1960. In that case, as in the present one, The Commission was dealing with 3 locked-in periods and one future period. The Commission there approved an agreement (not assented to by the Staff) on all other points, but with the rate of return left, by the customers, to the Commission for determination. Such objections as were raised by the Staff in the Manufacturer's case appear not to have gone to accuracy of data on costs, but to the fact that rate reductions would be entirely in the commodity element of rates, which would result in some deviation from The Seaboard formula, to the apparent relative disadvantages of small customers. The Commission's allowance there was a rate of 6¼% for the locked-in periods, which, taken together, extended from July 14, 1957 through November 30, 1959 and anticipated rate of return of 6½% for the prospective period beginning November 30, 1959. It should be noted in this connection that the return on common equity allowed for the locked-in period was less than the 10% which Alabama-Tennessee seems to consider a minimum requirement. In our study of the Commission's policy as to rate of return, consideration has also been given to two other decisions rendered by the Commission, subsequent to the presentation of the direct testimony of Mr. O'Neil. The most recent decision, which covers a period almost identical with that of the period involved in the prespective rate increase application in Docket No. G–19984, is the decision contained in an order of the Commission rendered March 20, 1961, in the case of Panhandle Eastern, Docket No. G–19780, 25 FPC 550. Consideration

[2] In its allocation exhibit, for the calendar year 1959 Alabama-Tennessee used an average of the 3-day periods of January 4, 5, and 6, 1959 and March 2, 3, and 4, 1960.

was given to that order because it shows some evidence of Commission policy as to rate of return. The effective date of the rates involved is March 26, 1960, ten days prior to the effective date of the rates involved in Docket No. G–19984. In that case (Panhandle) the Commission provided for an overall rate of 6.25%.

The other case to which consideration has been given, and of which we take notice as a matter of Commission policy, is that of Tennessee Gas Transmission Company (the sole supplier of Alabama-Tennessee) and the rate increases in question were those contained in the application in Docket No. G–19983, which is the very rate increase proposal upon which Alabama-Tenessee based its application for a rate increase in Docket No. G–19984. The period covered begins at the identical effective date applicable in Docket No. G–19984, to wit: April 5, 1960. The rate of return approved in that case (Docket No. G–19983), by the Commission's interim order, was 6⅛%, subject to future determinations as to accumulated deferred taxes and tax benefits for statutory depletion and intangible drilling expenses and to final determination on rate of return to be allowed for well-mouth production properties. Since Alabama-Tennessee produce no gas, the question of well-mouth production involved in the Tennessee case presents no problem here. The interim order in the Tennessee case (Dockt No. G–19983) was issued August 9, 1960, 24 FPC 204.

Alabama-Tennessee, in its 1959 Annual Report to stockholders, placed in evidence by reference, stated the earnings on its common stock ($1.00 par value) to be $1.37 per share in 1958 and $1.52 per share in 1959. While the cost of money has increased to some extent since 1954, the exhibits do not indicate an increase in such cost of magnitude sufficient to justify the return on investment which the Applicant now seeks. This is especially true as to the earlier rate increase requests here under consideration and we are somewhat surprised to find that Applicant's claim for return, presented by witnesses and alleged in its briefs, are in each case considerably in excess of the return sought by the application, filed seasonably by Alabama-Tennessee, at a time when the general nature and extent of the anticipated increased costs were known to it.

Upon a study of the whole record, we do not find the rates of return, proposed by Alabama-Tennessee in the first three applications under consideration here, to be unreasonable. We do not, however, feel that the evidence supports the claims of Alabama-Tennessee for the greater rates of return claimed by its witness during the hearing sessions and by its counsel in his briefs. Neither is it believed that the record justified the 6.5% return asked in the Docket No. G–19984 application. We do, however, as previously stated, believe that the record justifies an expected return of 6.4% to Alabama-Tennessee.

In considering proposed rates of return, as well as proposed rates, special consideration has been given to certain items of claimed investment and expenses, which are hereinafter discussed separately. Consideration has also been given to the Tennessee and Panhandle decisions hereinbefore referred to and to the cost of money statistics presented in evidence in this proceeding. A future rate of return of 6.4% does not appear unreasonable. The difference in results between the 6.4% and 6.5% rates of return amounts to between ten and eleven thousand dollars.

The Applicant's cost of service exhibits show varying rates of return for the various parts of the locked-in periods during which each of the proposed rates in Docket Nos. G–5471, G–11982 and G–17218 is to be applicable. Such fragmentation of the rates of return would be undesirable, even if it did not operate to provide rates of return greater than those which were sought in the applications. Certainly it appears undesirable here.

While the Staff has not varied its proposed rates of return within the period of applicability of any single rate proceeding here under consideration, it has applied the rate of return of 6.25% proposed in the Docket No. G–17218 application to the investment and working capital of Alabama-Tennessee for the prior years or parts of years to which the Docket No. G–5471 and Docket No. G–11982 proceedings are applicable. As previously stated, no justification for rates of return higher than those sought in the several rate increase applications has been shown by any party in the course of these proceedings.

Regulatory Commission Costs and Test Years

In the determination of operating expenses, Alabama-Tennessee, Staff Counsel and the Intervener are far from agreement in the item of regulatory commission expenses, which is recognized by each of the parties to be a part of the net working capital requirements which must be determined in arriving at the base upon which to determine the return allowable to Alabama-Tennessee in each of the several proceedings. Alabama-Tennessee arrived at this item, which is shown as part of the adjusted administrative and general expenses in each cost of service which it presented, by adding, to the actual amounts charged to deferred expenses in Account 146 for this purpose in each year, one-fifth of the estimated total expenses of the present group of proceedings, less such amounts as were actually charged to regulatory commission expenses during each period of a calendar or other year, for which a statement of overall cost of service was presented by its witness. In addition, it proposes to charge in each of the years 1955, 1956, and 1957, one-third of such unamortized regulatory commission expenses from earlier rate proceedings as it is now claimed that had not been recovered by Alabama-Tennessee as of December 31, 1954.

In its exhibits, Alabama-Tennessee presented overall cost of service studies and allocation thereof, on an actual basis, for the calendar years, 1955, 1956, 1957 and 1959. In addition Alabama-Tennessee presented a similar overall cost of service and an allocation thereof on a prospective basis for the calendar year 1959 adjusted to show estimated increased costs which would have resulted from the proposed increased rates if Tennessee's rates applied for in Docket No. G–19983 had been applicable during this period, as well as the estimated wage increases and additional personnel for which Alabama-Tennessee claims reimbursement in its application in Docket No. G–19984.

Subsequently, at the request of the Presiding Examiner, Alabama-Tennessee presented similar cost of service and allocation studies broken down to show actual cost for the period from January 1, through July 13, 1957 during which the G–5471 rates are to be applicable and for the period July 14, through December 31, 1957 for which rates may hereafter be fixed in Docket No. G–11982 would be applicable. A similar breakdown for the calendar year of 1959 was prepared and presented by Alabama-Tennessee, exhibits being presented to show the overall cost of service and allocation thereof separately for the period of January 1 through May 14, 1959 to which rates to be determined in Docket No. G–11982 are to be applicable and for the period May 15, through December 31, 1959, for which period the rates are hereafter to be determined in Docket No. G–17218. In addition, Alabama-Tennessee presented an allocation of the overall cost of service for the calendar year 1959, adjusted to give effect for the full year to the rates made effective under bond as of May 15, 1959 in Docket No. G–17166 of Tennessee and G–17218 of Alabama-Tennessee.

The Commission's Staff presented a cost of service exhibit, which was broken down by calendar years, with two additional sets of cost of service figures. The first of these additional sets was for the 12-month period ending June 30, 1957 and the other was a modified cost of service study for the year 1959, on a

prospective basis, showing costs as they would have existed for the year 1959, if the future known cost increases had been made applicable to the 1959 volumes purchased as well as to the other items of claimed increased expenses which were set out in the application in Docket No. G–19984. In presenting the Commission Staff's showing of cost of service for the various periods named above, the item of regulatory commission expenses is limited, in each case, to a much smaller amount than that claimed by Alabama-Tennessee and does not include any allowance for current rate case expenses or for similar expenses in previous rate cases claimed to remain unamortized on the books of Alabama-Tennessee as of December 31, 1954.

In spite of the previous request made to Alabama-Tennessee upon the record by the Presiding Examiner, the Commission Staff did not present breakdowns for the years 1957 and 1959 between the periods for which different rates are proposed to be made applicable, as a result of anticipated action of the Commission fixing both the time when each of the proposed rates would become effective under bond, such dates being the dates from which such rates as may hereafter be fixed in each of the consolidated rate proceedings will be effective.

The Intervener presented cost of service and cost allocation exhibits for the calendar years 1955, 1956 and 1958 on an actual basis. In addition, the Intervener presented an exhibit broken down for the year 1957 to separately show the cost of service and the allocation thereof for the period January 1 through July 13, 1957 and for the period from July 14 through December 31, 1957. The Intervener also presented a cost of service and cost allocation for 1959, showing separately such costs of service and the allocation thereof for the period from January 1 through May 14, 1959 and for the period May 15 through December 31, 1959. The Intervenor further presented cost of service and cost allocation studies on an actual basis for the 3-month period from January 1 through March 31, 1960, and for the year ending March 31, 1960, on a prospective basis with gas purchases at Tennessee's Docket No. G–19983 rates.

The Intervener would apparently allow, in the first three years, the regulatory commission expense from previous rate cases, which was claimed by Alabama-Tennessee. The Intervener would not, however, allow the costs of the present proceedings as part of the annual expenses during the years prior to Commission action, but would postpone their recoupment by Alabama-Tennessee until the future period. This would have the effect of making them collectable only from customers paying under the Docket No. G–19984 rates which are determined here. We cannot find this to be equitable.

Alabama-Tennessee's estimate of the regulatory cost of the present four cases is $75,000. Admittedly, some part ($25,000 to $30,000) represents anticipated cost to be incurred by Alabama-Tennessee in review of these proceedings by the courts after completion of the determination to be made by the Commission. It appears desirable to allow Alabama-Tennessee only half of the $30,000 or $15,000 of the possible court costs plus the $45,000 estimated as costs of these proceedings and to spread the estimated costs of the proceedings (reduced to a rounded figure $60,000) over an eight year period at $7,500 per annum, which would carry such costs evenly through the years 1955 to 1962 inclusive and distribute them among customers under all four proceedings . The reduction of $15,000 is based upon our belief that to the extent of at least 50%, any proceeding for review upstairs will relate to the effect of the rates which may be developed by the Commission, upon the direct sale rates of Alabama-Tennessee and upon the level of industrial gas costs generally, as well as being in large part for the benefit of the stockholders of Alabama-Tennessee.

The Staff has proposed separate and various rates for the portions of the applicable period of each of the locked-in rate proceedings coming within differ-

ent calendar years. While such a practice appears to have been followed in a few previous cases involving other pipeline companies, there is nothing in the record to indicate its desirability here and it is felt that a practice which increases the number of rate determinations to be made by the Commission should not be invoked unless clearly required as a matter of justice to customers. While it may be feasible in some cases to determine a separate rate for each calendar year or part thereof during which an applicant has sought for relief in a particular rate increase application proceeding, it is not believed this would result in the most equitable rates here.

We have therefore determined upon a test year applicable to each of the four proceedings and have then checked the results of the test year against the apparent results of the utilization of the rates thus determined upon both the applicant and upon its distributor-customers during the remainder of the period for which each such rate would be applicable. In doing this, we have treated the year 1955 as the test year in Docket No. G–5471, the year 1958 actual as the test year in Docket No. G–11982, the year 1959 actual (with any applicable adjustments) as the test year in Docket No. G–17218 and the year ending March 31, 1960 prospective (with prices adjusted to reflect Tennessee's rates in Docket No. G–19983), as the test year in Docket No. G–19984.

Alabama-Tennessee's last rate case prior to Docket No. G–5471 was settled, as appears from the order of March 18, 1954 in Docket Nos. G–2253 and G–2336. This must be assumed to have been a compromise of all interests. Moreover, the theory that one rate case in five years can reasonably be anticipated has been outmoded by inflation and the Phillips case. Accordingly, it cannot be found that any part of expense for earlier rate cases should be included in the rates determined here.

Study of Alternate Source

Alabama-Tennessee seeks authority in these proceedings to capitalize the expenditure of an item of $11,344 spent several years prior to the date of the first proposed rate increase filing which is under consideration here. The item in question represents costs incurred in 1951 or 1952 in connection with proceedings before this Commission, in which Alabama-Tennessee sought to obtain an additional or supplemental gas supply from Texas Eastern Transmission Company (Texas-Eastern).

Since the proposal was not approved by this Commission and Alabama-Tennessee never obtained any natural gas from Texas Eastern as a result of the efforts which resulted in the expenditure of this $11,344, we cannot find any justification for capitalization of the amount involved. It should, however, be clearly understood that the action taken here should not in any way be considered as constituting or reflecting agreement with the Staff's argument at page 25 of its brief that (because the record does not show any immediate inadequacy of Alabama-Tennessee's gas supply), the item in question was not one which could properly be expensed by that company. In fact, this type of costs and charges would appear to be very properly expensed for both tax and regulatory purposes during the year in which they may be incurred.

It is all very well to talk about the duty of the Commission to protect the rate payers from improvident and non-productive corporate excursions. This argument might well apply if the management of Alabama-Tennessee had sought to engage in some business foreign to its normal pipeline operations, such as the development of a coal mine or the operation of a barge line on one of the rivers within its area of operation. The seeking of a second source of the very product (natural gas), the transportation and sale of which constitutes the principal business of Alabama-Tennessee, is well within the scope of

the company's regulated operations and refused to recognize and permit recovery of the costs incurred in an attempt to obtain such alternate or additional supply would constitute an unwarranted assumption of the duties of management by the regulatory agency and an example of the very type of bureaucratic dictation to regulated business, which is one of the principal and strongest arguments of those who are inclined to be critical of all regulation and who seek to return to the early nineteenth century policy of "laissez faire" as to individuals and corporations engaged in business involving the public interest. In the present case, this presents no problem, however, since the expenditure was made at a time well before the presentation for filing of the Docket No. G–5471 application (the oldest application under consideration here) and at a time when management appears to have been well satisfied with the current effective rates and the returns to the stockholders, which were produced by such rates.

Costs of Compression

Alabama-Tennessee argues for special treatment and a departure from this Commission's usual practice in the allocation of the cost of fuel, supplies and maintenance of their compressors. The theory of the Applicant is that its compressors are used only to meet hourly peaks and that this makes them something other than facilities depending upon transmission volumes. We cannot agree with the theory upon which they seek to obtain special treatment for these costs.

It is possible that the recent tendency of the Commission to look more closely than formerly at the end use to which natural gas is intended to be put may make it both desirable and necessary to revise some of the allocation principles, which have been generally followed since the Atlantic Seaboard case[4] was decided in 1952. For instance if limitations are to be placed upon the sales of gas for boiler fuel and similar purposes in the off-peak periods (either by voluntary Commission action or because of a legislative mandate), it would seem appropriate to depart from the equal division of most fixed costs between demand and commodity and to charge a much larger proportion of such costs to the demand category. It does not, however, appear that the time for such departure has arrived or that this is a case requiring such special or changed treatment in the allocation of fixed costs and they have therefore been divided equally between demand and commodity, for the purpose of testing the validity of rates proposed or considered here. The compression costs in question here are charged to commodity.

The Proposed Modification of the Depreciation Rate

Alabama-Tennessee proposes an increase in its depreciation rate from 3.2% to 3.5% per year, effective July 1, 1957, to conform with an estimated 24-year remaining life. To reflect this proposed change in the depreciation rate it has shown, it included increased amounts in its estimated cost of service. The reasons Alabama-Tennessee advances for this increase are that Tennessee has proposed an identical rate of increase in its depreciation rate, effective July 1, 1957, in its filing made in Docket No. G–11980 and that Tennessee is Alabama-Tennessee's sole source of gas.

The Staff contends that the reasons advanced by Alabama-Tennessee for this increase in depreciation rate have no persuasive substance. Alabama-Tennessee relies upon the conclusions first, that Tennessee will be unable to supply gas 24-years hence, and second, that Alabama-Tennessee's plant will be useless in

[4] *In the Matter of Atlantic Seaboard Corporation and Virginia Gas Transmission Corporation*, 11 FPC 43.

consequence. There is no evidence in the record that gas from Tennessee's system will be unavailable to Alabama-Tennessee 24-years hence. Moreover, there is at present another transmission line within practicable reach of Alabama-Tennessee, and competing with Tennessee in Alabama-Tennessee's marketing area. And it appears not only possible but probable that Alabama-Tennessee may have acquired at least one additional source long before the expiration of the twenty-four year period which is claimed to be the remaining life of Tennessee's reserves.

Municipal Association contends that since Tennessee's change in depreciation rate has not been approved by the Commission, Alabama-Tennessee's proposal cannot be approved at this time. The Municipal Association further suggests that the use of the changed depreciation rate will require adjustments to the rate base for past and prospective periods to reflect a modification of the depreciation reserves as well as an income tax adjustment.

It would not make any serious difference to Alabama-Tennessee if the depreciation rate to be allowed is 3.2% or 3.5%, because any increase in the annual depreciation charge will be largely offset in the annual expenses of the company by the corresponding yearly reduction in the rate base of Alabama-Tennessee. Moreover, the evidence presented by AlabamaTennessee on this point was rather inconsistent and entirely dependent upon whether another Hearing Examiner of the Commission in another proceeding affecting Tennessee should see fit to increase the annual depreciation rate of Tennessee from 3.2% to 3.5%, beginning July 1, to conform with an estimated 24-year remaining life.

The question of rate of depreciation is primarly a matter of accounting procedure. The Natural Gas Act does not provide that a change in such procedure requires a hearing. The question of depreciation rate is not really ripe for determination until a similar determination is made in the case of Tennessee. Whether a change of the same nature in the case of Tennessee should be carried forward and made applicable to Alabama-Tennessee is a question which should be considered separately from the present rate case. As suggested by the Staff, it is possible that alternate gas supply sources available to Alabama-Tennessee may make it undesirable to treat the depreciation allowances of that company upon the same basis as that of Tennessee. Parenthetically, it may be noted that Staff Counsel's position in this regard is, to some extent, inconsistent with Staff Counsel's argument to the effect that money spent by Alabama-Tennessee in surveying the desirability of an alternative source of gas should not be allowed as part of the annual expenses of operation of Alabama-Tennessee in the year in which such money was spent. It will be noted, moreover, that the Presiding Examiner's refusal to consider the expense of such alternate-source investigation as a part of Alabama-Tennessee's cost of service is based on the totally different ground that such costs were accumulated at a time when there was no indication that Alabama-Tennessee's rates were too low.

The Proposed Allocation of "Customer Costs"

Alabama-Tennessee has proposed to modify the customary classification of costs, between "demand" and "commodity", by the injection into the classification picture of a third class of costs, designated as "customer costs". These "customer costs" are claimed to include portions of the return, depreciation, taxes and operating expenses, assigned to city gate and main line measuring and regulating stations. Related expenses for customer accounting and collection and sales promotion expense are also included within Alabama-Tennessee's classification of "customer costs".

While it is conceivable that the classification of certain costs as "customer costs" may be right and proper in some cases, the evidence presented in this case does not sustain the burden resting upon the rate-increase applicant of justifying the classification by it of certain costs, as "customer costs". In fact, there is not even a satisfactory showing that the type of costs included as "customer costs" are those to which such a classification could best be applied. Some of such costs are claimed to be assigned on a weighted meter-count basis. The record is not clear however as to whether such weighting was based upon size of meters, frequency of meter-reading or the amount of employee-time required for each reading. In the absence of such showing and of positive and convincing evidence that the variations in cost of metering facilities or the time required for the reading thereof materially affect the overall operating costs of Alabama-Tennessee, the weighted meter method of classifying costs to customers can contribute nothing toward a proper allocation of costs, upon which Alabama-Tennessee's rates can be based.

Other costs assigned by Alabama-Tennessee to the category of "customer costs" included return, depreciation and taxes, as well as certain operating expenses of those facilities described as "distribution plant" by Alabama-Tennessee. It has not been shown that the proportions of such "distribution plant" facilities used to serve any one class of customers was either excessive or inequitably small. In the absence of such a showing, it would appear that the placing of costs, allegedly related primarily to distribution, in a classification other than those of "demand" or "commodity" is unnecessary and could serve no purposeful end, unless it be to (in effect) shift part or all of such costs from the "demand" category to the commodity category, or vice versa.

To the extent that they represent capital costs of facilities, the type of costs described in the preceding paragraph may, in some sense, become sufficiently important to require some special treatment. However, such special treatment would not necessarily be by classification of costs here proposed. If some special rate, applicable to those customers for whose sole benefit certain distribution laterals or special measuring and regulating facilities were required, this could be taken care of, if necessary, by creation of a special "zone". A more satisfactory alternative might be the obtaining of contributions in aid of construction, whose liquidation might be provided for by special contract and with little or no interest payment required in the meantime. The use of such contributions in aid of construction is not uncommon in the case of direct industrial contracts for sale of gas by pipelines. Here, of course, no regulatory problem exists and the procedure serves to keep the cost of facilities, used only for unregulated business, out of the rate base, upon which rates to jurisdictional customers are to be computed.

Another type of costs classified as "customer costs" by Alabama-Tennessee was the allegedly-related expenses for customer accounting and collecting and for sales promotion. The propriety of the assignment of such accounting, collecting and sales-promotion costs, as have been included in this category by Alabama-Tennessee, has not been established by any facts in evidence here. The billing and accounting costs are comparatively small in a company, like the present one, where the total number of customers (utility and direct industrial) is less than a score. Sales promotion costs of the pipeline company are usually (in an area like that of Alabama-Tennessee) accrued in an attempt to acquire interruptible industrial customers for either the pipeline or its utility customers.

Where sales promotion costs are accumulated in a campaign for new residential or commercial customers, they are usually developmental and in an attempt to help the newer or smaller municipal or private utilities. The new and

usually small-at-the-start utility customers of a pipeline company are the ones least able to bear the whole of the costs of a sales campaign. The older and unusually larger utility customers are in much better position to budget a certain proportion of their annual revenues for promotional purposes and such older utility customers frequently put on campaigns for new customers, in which the only assistance sought from the pipeline is the availability of the necessary natural gas to supply the demands (of additional customers or expansion of service to existing customers) generated by the campaign.

Expense wise, the part played by the pipeline in any developmental campaign of a utility customer may well be in inverse ratio to the size of the customer and its ability to pay for such a campaign. To permit the cost of such service to be added to the cost of the class of customers least able to bear such a burden would not constitute sound regulatory policy. Here, however, there appears to be no attempt to charge such costs to any one class of customers and no useful purpose can possibly be served by creation of the proposed classification of "customer costs".

Other cost of service deductions proposed by the intervener

In the testimony of the witness Van Scoyoc and the principal brief filed by the Municipal Association, certain additional items which had been claimed as income tax deductions by Alabama-Tennessee are proposed to be treated in the same manner in the cost of service studies made as to the years 1955 and 1957. The cost of service studies in each year have not been utilized for separate computations of rates for each year or part of a year, when a proposed rate was to be effective under Alabama-Tennessee's various applications, but selected test years have been used in determining the rates for each entire period, when proposed rates to be charged by Alabama-Tennessee to its various customers, were effective under corporate undertaking pending leasing and determination in regard thereto. It is obvious that under what may be described as a "test year method," non-recurring items, while possibly entitled to some overall consideration, if too many in number and all tending in one direction, are not a proper part of the test-year cost of service upon which rates are to be based.

In the 1955 cost of service exhibit of the intervener, it is claimed that a tax deduction in the amount of $3,026 representing the premium part on bonds retired during the year 1955 should also be treated as a deduction from the cost of service accrued by Alabama-Tennessee in that year. This item is a one-year item based on bonds retired during the year 1955 and is non-recurring. For that reason it does not appear that it should be utilized as a reduction in the cost of service, which cost of service should represent the costs incurred by Alabama-Tennessee in a normalized year.

The Municipal Association has raised a similar claim in regard to an item of $8,747 included in the cost of service exhibit presented by said Municipal Association for the period of January 1, 1957, to July 13, 1957, and the period from July 14, 1957, to December 31, 1957. This is a composite cost of service study for the year 1957 which purports to reflect costs, distributed to two periods when different rates are proposed to be effective. If 1957 were to be considered as a test year, the same treatment as in the case of the bond-premium would be given this proposal, which represents the compensation of officers charged to construction work then being carried on and for which tax exemption was claimed. However, this is immaterial here, since 1957 is not being used as a test year period, the rates to be allowed during the locked-in period covered by Docket No. G–5471 being based upon the 1955 test year and those for the period covered by Docket No. G–11982 being tested by the 1958 cost of service.

Another item claimed as a deduction in the 1957 year was an amount of $14,016 for depreciation of rights of way. Insofar as 1957 is concerned this might be disregarded in the same way. However, the same situation occurs in regard to right-of-way depreciation in 1958 which is a test year. Alabama-Tennessee claims this is not to be treated as a credit even though claimed as a tax deduction for the year. There is testimony in the record which makes it clear that the Internal Revenue Service has refused to allow similar items in certain other years and that, because of such action on the part of the Internal Revenue Service, Alabama-Tennessee has agreed to the payment of increased taxes during such years and has filed corrected tax returns in which the right-of-way depreciation is not claimed for other years in which such claims had previously been made, but as to which the tax returns have not yet been audited by the Internal Revenue Service. It is impossible to agree with the argument of the Municipal Association that there is an obligation on the part of a natural gas pipeline company to appeal from a decision of the Internal Revenue Service in a case like this. Not only is the amount involved too small to justify such an appeal, because the cost of appeal may very well exceed the amount saved, but it does not appear that there is any solid ground upon which such an appeal could be successfully prosecuted.

Merit Increases

Alabama-Tennessee claimed that, in the determination of the future rate, consideration should be given to certain increases (described as "merit increases") in wages and salaries of employees. Staff counsel argued that such costs have not been shown to have been incurred in any test year period and that when incurred they will not increase unit costs. In doing this the Staff adopts a conclusion stated by Municipal Association's witness Van Scoyoc, who pointed out that previous salary increases during the period beyond 1955 and 1959 have (on unit bases) been more than offset by increased efficiency of operation.

In fact the studies submitted by the witness Van Scoyoc indicate that the amount of salaries and wages charged to operations in 1955 amounted to $239,046 while in 1959 the total amount charged to operations for such salaries and wages was only $220,398. This indicated that, on a unit of sales basis, the operating labor cost decreased during the period 1954 through 1959 from 2.374¢ per Mcf to 1.70¢ per Mcf of gas. This decline of approximately 67¢ per Mcf amounted to an approximately 28% reduction in the unit cost for labor.

The very use of the term "merit increases" indicates that the purpose of the said increased wages and salaries was to reimburse employees for increased efficiency of operation. Such increased efficiency can be expected to continue in the future and to result (as in the past) in a constantly decreasing unit cost of labor for operations of Alabama-Tennessee. In accordance with the reasoning outlined by the intervener's witness and by staff counsel in their brief, which appears both rational and proper, the claim of Alabama-Tennessee to have such alleged merit increases (to become effective in the future) made a part of the cost of service for the test year, for the rate to be authorized hereafter in Docket No. G–19984, has been disallowed. The total amount involved appears to be $12,267, which should be easily absorbed by the increased volumes expected to be transmitted and sold by Alabama-Tennessee in the future.

Load Factor of Rate Schedule SG–1 Sales

Two of the rate increase proposals of Tennessee, upon which Alabama-Tennessee relies as support and reason for its proposed increases did not call

for any increase in the demand charge of Tennessee. These two rate increases of Tennessee, are the proposed increase in Docket No. G–5259 upon which Alabama-Tennessee relies as the reason for its own proposed increase in Docket No. G–5471, here under consideration, and Tennessee's application in Docket No. G–17166, upon which Alabama-Tennessee relies as the support and reason for its proposed increase in Docket No. G–17218.

In its application in Docket No. G–11982, Alabama-Tennessee recites the fact that under an application filed by Tennessee (Docket No. G–11980) Alabama-Tennessee will experience an increase of 20¢ per Mcf of monthly billing demand and 1.9¢ per Mcf of commodity cost on all gas bought by it from its sole supplier, Tennessee. In order to support the proposed increase of 4.1¢ per Mcf in the price of gas delivered to its smaller public utilities customers under its SG–1 rate schedule Alabama-Tennessee claims to be entitled to bill such customers at a price equivalent to the rates to G–1 customers operating at a 30% load factor. Alabama-Tennessee claims that a 30% load factor is the approximate load factor experienced by its SG–1 customers during the 12 months ended November 30, 1956.

The application for rate increases of Alabama-Tennessee in Docket No. G–19984 is claimed to be based upon increased rates proposed by Tennessee in Docket No. G–19983 filed at practically the same time that Alabama-Tennessee's Docket No. G–19984 application was filed. Tennessee's proposal contained in its Docket No. G–19983 application is for the retention of the commodity charge being collected under bond and an increase of 85¢ per Mcf in the monthly billing demand to be paid by Alabama-Tennessee. In Alabama-Tennessee's proposal for increased rates filed October 5, 1959, it is proposed that customers buying gas under Alabama-Tennessee's rate schedule SG–1 be required to pay an increase of 13.3¢ per Mcf. Alabama-Tennessee claims that this is the equivalent of the increase applicable to its rate schedule G–1 customers at a 21% load factor and states such 21% load factor to be the approximate load factor expected to be experienced by the SG–1 customers during the 12 months ending April 30, 1960.

It appears from the study of past records that the historical load factor calculated for the SG–1 rate schedule of Alabama-Tennessee has been approximately 45%. While this may appear to result in some slight subsidy to the SG–1 customers, it should be kept in mind that the small customer of today may well be the large customer of tomorrow, with any pipeline company. Rates given to such small customers are in most cases developmental rates to enable such customers to build up their load. As the load is built up, the profits of the pipeline tend to increase. If rates to these small customers were to bear their full proportion of the demand costs of the pipeline company in a mathematical manner, it is doubtful whether such small communities would find it economically feasible to put in distribution systems and develop a market for natural gas within their borders. This is true both as to the municipal agencies principally involved here and as to privately owned public utilities or small communities seeking to be served through private public utilities.

It may be noted that Alabama-Tennessee has in the past increased its number of public utility customers by offering to render service to small communities or communities in which the natural gas market would be developed over a period of several years. Such customers appear to have been connected and sought by Alabama-Tennessee on the basis of the approximately 45% load factor developed in the SG–1 rate of Alabama-Tennessee. By order issued September 23, 1955, 14 FPC 986, upon an application filed August 6, 1954, Alabama-Tennessee was authorized to construct additional facilities to serve

Russellville for the first time and to increase service to the Lawrence-Colbert Counties Gas District. This was the result of an application of Alabama-Tennessee and not because of any 7(a) proceeding to require service.

No question seems to have been raised in the past as to the 45% load factor made roughly applicable to the SG–1 rate. There is no reason why customers relying upon such past treatment should now be penalized. This is especially true because of the comparative unimportance of the volumes supplied. In the year 1959, for instance, the total volume of sales to all SG–1 customers of Alabama-Tennessee was 375,445 Mcf out of total jurisdictional sales of 6,997,059 Mcf. The total sales, including nonjurisdictional sales, made by Alabama-Tennessee were 12,959,452 Mcf, in the year 1959.

The total jurisdictional sales of Alabama-Tennessee during the year 1955 were 4,321,800 Mcf of which total 320,779 Mcf were sold to six Rate Schedule SG–1 customers. These six included Athens, Alabama which has since become a G–1 customer and did not include Russellville which was not served with natural gas by Alabama-Tennessee until October, 1957, and whose connection to the Alabama-Tennessee system has been discussed above.

The City of Athens, Alabama was a Rate Schedule SG–1 customer of Alabama-Tennessee until March 1, 1958, according to the service agreement of that company as a Rate Schedule G–1 customer filed with this Commission and made a part of the record in these proceedings by reference. At the present time Hartselle, Alabama which is a Rate Schedule SG–1 customer of Alabama-Tennessee is rapidly approaching the point where it will, of necessity, become a Rate Schedule G–1 customer of Alabama-Tennessee. Incidentally, it may be noted that Russellville (the last Rate Schedule SG–1 customer attached) was stated to be second only to Hartselle in both annual and peak day deliveries during the year ending August 31, 1959, in exhibits to the application in Docket No. G–19984. This is established in the record (as to peak day volumes taken) by Alabama-Tennessee's own report to its stockholders, which is in evidence by reference, having been filed as part of its 1959 report to this Commission.

The 1959 volumes of gas sold by Alabama-Tennessee to its Rate Schedule SG–1 customers amount to only 375,445 Mcf out of a total of 6,997,059 Mcf, as previously stated. It will be observed that in the past several years the proportion of Rate Schedule SG–1 gas to the total jurisdictional sales of Alabama has decreased. It may be noted that Alabama-Tennessee is increasing not only its jurisdictional business but also its nonjurisdictional business wherever possible. In the 1959 annual report to stockholders, which is an item by reference in this proceeding, as previously stated herein, the stockholders are informed of a 10 year contract signed by Alabama-Tennessee with Tennessee River Pulp & Paper Company. This contract is for 6,000 Mcf of natural gas per day on an interruptible basis and requires the Paper Company to take or pay for a minimum of 75% of the contract quantity when available during an operating year of 340 days. Alabama-Tennessee also has interruptible gas sales contracts with Tennessee Valley Authority and with Reynolds Metal Company. Increases in annual volumes of sales to Reynolds Metal Company, Tennessee Valley Authority and Ford Motor Company were attended during 1959 by corresponding increases in peak day requirements. Low load factors of Rate Schedule SG–1 customers (at least to the extent by which they are less than the 45% load factor used in calculating the SG–1 rate) are no hardship to Alabama-Tennessee, which can sell the gas to interruptible industrial or Rate Schedule I–1 customers.

In summary it can be said that in relation to the total sales volumes of Alabama-Tennessee, the Rate Schedule SG–1 sales are only a drop in the

bucket. Apparently, the approximately 45% load factor upon which the said SG–1 rate has been based in the past has been a contributing factor in the successful development of Alabama-Tennessee's markets. No reason can here be seen for departing at this time from the established pattern of the said rate schedule and it is upon this basis that the Rate Schedule SG–1 rates, for the three locked-in periods and for the period beginning April 5, 1960, have been calculated.

The Interruptible Industrial Rate of Alabama-Tennessee

Prior to March 1, 1957, Alabama-Tennessee made no provision for an interruptible industrial rate in its agreements with its distributor customers. On March 1, 1957, Alabama-Tennessee filed its first or original I–1 Rate Schedule, to be effective April 12, 1957, for sale of interruptible industrial gas to its utility customers. The original filed rate was 25.1¢, which was increased to 28.3¢ by the Docket No. G–17218 filing of November 14, 1958, which became effective, subject to possible refund, May 15, 1959. While not legally subject to suspension because it was an industrial rate, Alabama-Tennessee (subsequent to the original filing in Docket No. G–17218) filed a statement with the Commission that it did not desire to collect an increased rate for interruptible industrial gas prior to May 15, 1959, when the increased rates of Tennessee Gas Transmission Company in Docket No. G–17166 became effective under Commission order.

The interruptible industrial rate carries no demand charge but is only a commodity rate. During the portion of the locked-in period of the Docket No. G–5471 proceeding in which this rate was applicable, the I–1 rate of Alabama-Tennessee was 25.1¢ per Mcf. Both Alabama-Tennessee and its utility customers seem to have been reasonably satisfied with the rate. We have not seen fit, as a matter of judgment, to disturb it. The same rate was continued during the locked-in period covered by Docket No. G–11982. In this case the difference between the I-1 rate and the commodity portion of the Rate Schedule G-1 rate of Alabama-Tennessee, as such rate is hereafter fixed in this decision, amounts to only nine-tenths of a cent per Mcf, as opposed to a differential of 3.4¢ per Mcf in the Docket No. G–5471 period. While a difference of only nine-tenths of a cent between the purely commodity interruptible industrial rate does not seem fully adequate, in our judgment, to a completely balanced rate structure, it is not possible for this Commission to increase a rate and the 25.1¢ rate for the Docket No. G–11982 period is not proposed to be altered.

In filing its application for increased rates in Docket No. G–17218, Alabama-Tennessee proposed an increase from 25.1¢ per Mcf to 28.3¢ per Mcf in its I–1 Rate Schedule. For the period covered by this rate and for which refunds in other rates are hereafter ordered, the 28.3¢ rate for interruptible industrial gas is only four-tenths of a cent higher than the rate hereafter found to be the reasonable rate for the commodity element of the Rate Schedule G–1 rate. However, as previously stated, the Natural Gas Act does not authorize increases of filed rates by direction of the Commission. Moreover, there remains a possibility that reductions may hereafter be made in the rates of Tennessee, which is presently the sole supplier of the natural gas sold under various rate schedule by Alabama-Tennessee. In the event that additional refunds may hereafter be required of Alabama-Tennessee because of refunds received by it from its supplier, it will then be possible to so distribute such refunds as to adjust the interruptible industrial rate to the rate applicable to the commodity factor in the Rate Schedule G–1 rate, more equitably.

As a matter of policy and of sound discretion in the adjustment of rates, it is believed that a differential of approximately 2¢ per Mcf constitutes a reasonable minimum difference which should be maintained, in the absence of substantial reasons for other action, between the interruptible industrial or I–1 Rate Schedule of a company such as Alabama-Tennessee and the commodity factor of the G–1 Rate Schedule of such a pipeline company. Failure to maintain such a differential has a tendency to encourage attempts by distributors to seek indiscriminate industrial business, at a time when increasing demands for domestic use of natural gas in new areas and by new customers in old areas, as well as industrial demands of a type which are not competitive with other fuels, because such other fuels do not provide an equally or comparably satisfactory substitute for natural gas, are increasing gas-supply problems.

It is hereafter provided, for the refund periods as to which the rates being collected in Docket No. G–11982 and the rates being collected under Docket No. G–17218 are applicable, that in the event Alabama-Tennessee may hereafter receive refunds from Tennessee under the corresponding Docket Nos. G–11980 and G–17166 of Tennessee, the additional refunds to be made to utility customers by Alabama-Tennessee may be so adjusted that the resulting amount to be retained by Alabama-Tennessee under the I–1 Rate Schedule shall exceed the amount to be retained by Alabama-Tennessee as the commodity factor of its Rate Schedule G–1 by 2¢ or as much thereof as possible. It has not been felt necessary or desirable to make a similar adjustment for the period to July 14, 1957, where the differential between the commodity factor of the Rate Schedule G–1 and the Rate Schedule I–1 rate (strictly commodity) amounts to 3.4¢.

At the other end of the story in the present and prospective rates which have been collected by Alabama-Tennessee under Docket No. G–19984 since April 5, 1960, no adjustment is hereafter authorized in the event of a future refund by Tennessee to Alabama-Tennessee, because it is felt that the cost of making the adjustment and the resulting inconvenience to both Alabama-Tennessee and its customers would not justify an adjustment of two-tenths of a cent. In other words, it is felt that for all practical purposes here the 1.8¢ differential under Docket No. G–19984 between the Rate Schedule I–1 rate of Alabama-Tennessee and the commodity factor of the Rate Schedule G–1 rate of Alabama-Tennessee for the period beginning April 5, 1960 is near enough to the approximate 2¢ minimum differential which appears to be reasonable that no further adjustment should hereafter be required. It may be noted in this connection that the Rate Schedule I–1 as filed in Docket No. G–19984 remains the same as that filed in Docket No. G–17218. Moreover, Docket No. G–19984 sets future rates and circumstances which are only foreseen cannot be estimated with the precision, with which it is possible to determine past facts, as can be done in relation to the locked-in periods here under consideration.

The Temporary Peaking Service Rate

On December 29, 1955, Alabama-Tennessee filed a rate schedule for temporary peaking service to general service customers which it designated as its Rate Schedule TPS–G1. The TPS–G1 rate schedule of Alabama-Tennessee was to be effective only from the date when it was allowed to become effective by this Commission until April 30, 1956. It was to be available to only those general service customers served under Alabama-Tennessee's Rate Schedule G–1, as it then existed, who had met certain requirements as to the increasing of their billing demands under the contracts filed as service agreements under Alabama-Tennessee's general service Rate Schedule G–1, as it existed on April 30, 1955.

This rate schedule permitted the taking of additional gas in excess of the billing demand of the customer under Rate Schedule G–1 of Alabama-Tennessee, but not in excess of the maximum daily demand obligation specified in the buyers' general service gas sales contract. The demand charge under Rate Schedule TPS–G1 was to be $2.25 per month per Mcf of billing demand and 75¢ per Mcf as a commodity charge for all gas delivered.

The record shows that the only communities taking advantage of the TPS–G1 Rate Schedule were Tuscumbia, Sheffield, and Huntsville, all in the State of Alabama. Exhibit No. 4, submitted by Alabama-Tennessee, shows the billing demands units for the four month period and also the annual sales volumes for both G–1 and TPS–G1 sales. The total amount of the TPS–G1 Rate Schedule sales was only 488 Mcf. The billing demands for such sales amounted to 1192 Mcf. As a result, the total revenues for demand and commodity charges was $3,048 out of a total of $2,036,316.34 paid to Alabama-Tennessee by jurisdictional customers during the year 1956. No one bothered to put in any other evidence in the proceeding in regard to the TPS–G1 schedule, although the Staff's exhibit showing proposed rates for the locked-in Docket No. G–5471 period carries a footnote (without explanation) to the effect that no changes are proposed in Alabama-Tennessee's Rate Schedule TPS–G1, which was in effect from December 29, 1955 through April 30, 1956. There is, however, material in the application of Alabama-Tennessee for its subsequent rate increases in Docket No. G–11982, which shows that all of the gas delivered under the TPS–G1 rate schedule was delivered during the month of January, 1956. In addition there is, in Statement G of the Application in Docket No. G–11982, information which shows that the Rate Schedule G–1 billing demands as they existed in January, 1956, were not increased, by reason of the taking of greater amounts of gas, for at least 10 months, by any of the three communities of Tuscumbia, Sheffield and Huntsville.

It is possible to determine that (in the absence of the special peaking service provided by the TPS–G1 rate) each of the said communities would, if they had obtained the same quantities of gas (which they obtained under the TPS–G1 Rate Schedule) under the existing Rate Schedule G–1 rate, have paid at least three times as much for said gas. This resulted from the fact that while the Rate Schedule TPS–G1 commodity rate was almost triple the then effective commodity rate being charged under Alabama-Tennessee's Rate Schedule G–1, the monthly demand charge provided by Rate Schedule TPS–G1 was only five-sixths of the Rate Schedule G–1 demand charge and that the billing demand rate accruing in four months on the Rate Schedule TPS–G1 gas amounted to $9.00 as against $27.00 for a ten-month continuance of the $2.70 billing demand provided for in the Rate Schedule G–1 at that time.

In view of the fact that the intervenor, who represented the three communities in question, did not see fit to put in any substantial evidence in regard to the TPS–G1 rate and did not complain of said rate, it must be assumed that the three communities who bought gas under the rate had no complaint against the said TPS–G1 rate. In view of the analysis heretofore made and the showing that the three communities saved some two-thirds of the cost which they would have had to pay if they had taken the same volumes of gas in January 1956, under Alabama-Tennessee's then existing Rate Schedule G–1, no reason can be seen for allocating any portion of refund moneys for the Docket No. G–5471 period to the TPS–G1 gas.

Federal Income Taxes

In computing Federal income taxes for regulatory purposes herein, the tax allowance for liberalized depreciation permitted by the Internal Revenue

Service has not been so treated as to produce a reduction of the working capital allowance, in the cost-of-service studies made to determine the rates set herein. This procedure follows that of the Commission opinions in El Paso Natural Gas Company, Docket No. G–4769[5] and United Fuel Gas Company, Docket Nos. G–2451 and G–5475.[6] While the El Paso case here referred to was reversed at 281 Fed. 2d., 567, by the Circuit Court of Appeals for the Fifth Circuit, such reversal was on other grounds and did not invalidate the language contained therein in regard to liberalized depreciation. The Commission as a matter of policy has allowed the benefits of such liberalized depreciation to be retained by the pipeline company. In this connection it may be pointed out that liberalized depreciation, under Section 167 of the Internal Revenue Code, only shifts costs from one period to another. It does not relieve the tax payer from the eventual necessity of paying such costs. The determination by a tax payer as to whether to take advantage of such liberalized depreciation is a matter of sound business discretion and should be considered in relation to its effect upon the financial structure of the tax payer, rather than upon any consideration of its effect upon third parties or the benefits which they might receive therefrom.

From the standpoint of customers of Alabama-Tennessee, the allowing of that company to retain the benefits of the liberalized depreciation which it is permitted to take under Section 167 of the Internal Revenue Code raises only one question and that is whether certain costs should be paid now by present rate payers or passed on to further rate payers when it becomes necessary for Alabama-Tennessee to meet the postponed liability incurred by it under the Federal Tax statutes. It appears equitable that these costs should be paid by the present rate payers rather than by some future generation of rate payers, at a time when gas rates will probably be much higher than they are now. It is therefore found that the retention by Alabama-Tennessee of the temporary benefits due to accelerated depreciation, as provided for in the Internal Revenue Code, is in the overall public interest and should be permitted in these rate determinations.

No problem of statutory depletion or the expensing of intangible drilling costs, which may be allowed as a tax credit, is present in the present proceedings. Alabama-Tennessee does not produce any gas but purchases its entire supply. Neither is there any problem here of consolidated returns in which the tax losses of one affiliated corporation (whether regulated or not) may be used as an offset to taxes accruing to or for the regulated company whose rates are being determined. To the extent that it is necessary in these proceedings to consider modifications of the income tax structure of a minor nature, these modifications have been heretofore discussed in earlier portions of this decision and it is not necessary to again refer to them at this point.

Counsel for Alabama-Tennessee proposes that, in determining peak day demands in these proceedings, such determination be made upon the averaging of the 3-day peak period of the winter season which includes the beginning of each calendar year and the 3-day peak period occurring during the winter season which includes the end of the said calendar year. In their reply brief, they argued for the use of the average of the said two peak day periods upon the basis of their interpretation of Commission action in a case involving East Tennessee Natural Gas Company, Docket No. G–5470.[7]

[5] 22 FPC 260 at 265–267.
[6] 23 FPC 127 at 130–131.
[7] Commission order of February 17, 1961 in Docket No. G–5470 [25 FPC 295]

In these consolidated proceedings it has already been determined that neither the fixing of separate rates for separate portions of the period, during which the rates are to be determined in each of the four consolidated proceedings, nor the determination of such rates upon the basis of a consolidation of costs throughout the entire period in which a particular proposed rate was collected subject to possible refund, is desirable. It has been determined that rates for each of the three past periods, covered in Docket Nos. G–5471, G–11982 and G–17218, as well as the present and future rates involved in Docket No. G–19984, should be fixed upon the basis of an appropriate test year and such test years have been heretofore stated in this decision.

Consideration has been given to Alabama-Tennessee's suggestion of the use of the average of two 3-day peak periods. Upon such consideration it has been determined that use of such a combination of two 3-day peak periods would be undesirable in any of the four proceedings under consideration here.

A study of Alabama-Tennessee's own exhibit, showing cost of service data for the 12-months ended December 31, 1955, discloses that on December 31, 1954 the net gas plant actually in service amounted to $4,521,237.74. The total net gas plant in service, according to the same exhibit, on December 31, 1955 amounted to $4,503,408.19. The difference between the two figures amounts to approximately four-tenths of one percent. The 3-day peaks, which Alabama-Tennessee claims should be used for 1955, were 25,119 Mcf on February 10, 11 and 12, 1955 and 26,911 Mcf on November 28, 29 and 30, 1955. Both peaks occurred during the year 1955 and it appears clearly preferable to use the November peak, which is also the highest single peak, rather than the average of the two 3-day peaks. It may be noted, incidentally that the relationship of the jurisdictional and nonjurisdictional gas in the February and November peaks is approximately proportional.[8] There thus appears to be no sound reason for using an average of two 3-day peak days period in allocating demand charge for the 1955 test year, adopted for determination of the Docket No. G–5471 rates.

For the 1958 test year used in Docket No. G–11982, Alabama-Tennessee's cost of service exhibit shows net gas plant in service on December 31, 1957 of $5,804,811.59 and the corresponding figure for December 31, 1958 is $6,224,856.01. While a comparison of these two figures would show a variance of some 7 percent between the gas plant in service at the beginning and the end of the year, such a comparison would be misleading if used to justify the use of the average of two peak days periods as a basis for the allocation of the demand component of the cost of service.

Further study shows that gas plant in service remained fairly constant from December 31, 1957 through November 30, 1958 and was actually $37,000 lower on November 30, 1958 than on December 31, 1957. This would indicate that rather important facilities were completed and made available for service in December 1958. Turning to the two peak day periods suggested by Alabama-Tennessee, it appears that the first of said periods occurs on 15, 16 and 17 February 1958 and the second such peak period did not occur until January 4, 5 and 6, 1959, a date outside the test year period.

Since the smaller capacity was apparently available during eleven of the twelve months in question here, it would be misleading to use a peak period occurring in January 1959. As a matter of fact, the computation used in determining the rates to be applicable in Docket No. G–11982 (based upon the test year 1958) shows that the portion of the demand which is jurisdic-

[8] The nonjurisdictional peak of February 10, 11, and 12, 1955 amounted to 15,164 Mcf and the nonjurisdictional peak of November 28, 29, and 30, 1955 amounted to 16,236 Mcf.

tional amounts to 76.4917% as opposed to a figure of 74.91% arrived at by Alabama-Tennessee on the basis of the average of the two peak periods proposed by it. It is believed that the computation arrived at on the basis of the single peak period, February 15, 16 and 17, 1958, is more equitable than that proposed by the rate increase applicant.

For the year 1959, which has been used for the test year in Docket No. G–19984, Alabama-Tennessee shows actual net gas plant in service of $6,224,856.01 on December 31, 1958 and $6,469,269.12 on December 31, 1959. The difference here amounts to something less than 4%, but again there is an increase of more than $360,000 between November 30, 1959 and December 31, 1959 which apparently results from completion of facilities. The 1958-59 peak period used by Alabama-Tennessee occurs on January 4, 5 and 6, 1959.

The end-of-year 3-day peak period, did not occur until March 2, 3 and 4, 1960, approximately one month before the end of the period for which the rates determined upon in Docket No. G–17218 are to be applicable. It would appear that this fact alone would be sufficient to justify refusal to consider the double peak day proposed by Alabama-Tennessee. In this case, it may be noted that the overall percentage of jurisdictional to total demand used herein is 75.3789% as against 75.94% under the formula proposed by Alabama-Tennessee.

For the future rate to be determined in Docket No. G–19984, the 3-day peak period of March 2, 3 and 4, 1960 has been utilized to allocate demand between jurisdictional and nonjurisdictional. This rate is the rate which the utility customers (as well as Alabama-Tennessee) must live with for a future period, which it may be hoped will not be too short. The percentage of gas allocated to jurisdictional businesses upon the basis of this 3-day peak is 76.4584. It is believed that the use of a single peak day period for future rates is desirable. In fact the use of any other peak day period would be in no way related to the presently anticipated future volumes, would go beyond any period for which evidence has been presented in the present proceedings, and would be purely speculative.

Alabama-Tennessee's claim of support by the Commission's order of February 17, 1961, in the case of East Tennessee Natural Gas Company, Docket No. G–5470 for its proposed use of two 3-day peak periods has been heretofore noted. It should be noted also that, in that proceeding, the problem of determining a proper peak period for distributing demand costs was complicated by excess pipeline capacity,[9] which was available for storage of gas, and by the ability of East Tennessee to make an arrangement with its largest nonjurisdictional customer for reduction of peak day deliveries of firm gas, which permitted serving of interruptible gas requirements of both direct and resale customers of East Tennessee upon the peak demand period of the 1956-57 winter season. The available storage capacity had apparently permitted full delivery of both firm and interruptible demands in years prior to 1957. There is certainly no evidence here of storage capacity, such as may have been a factor in the East Tennessee case and there is no suggestion here of a backing-off of deliveries by any firm gas customer, either jurisdictional or nonjurisdictional, to permit deliveries of interruptible gas on peak days by Alabama-Tennessee. Moreover, substantial variations, from year to year, in the relative peak demand use of gas by jurisdictional and nonjurisdictional customers, referred to in the Docket No. G–5470 order of the Commission, are not present here.

[9] It is stated in the order of February 17, 1961 that; "There is some evidence in the record that a large portion of the pipeline was constructed of 22-inch pipe although a 16-inch pipe would have satisfied delivery requirements."

In fact, the variation in allocation to jurisdictional and nonjurisdictional sales peak periods demands (both applicable to Docket No. G–5471 rates) is less than one percent, being 62.37% jurisdictional in 1955 and 63.34% jurisdictional in 1956. The combination of the 1955 peak period referred to above and the January 1957 peak, applicable to the part of 1957 covered by the G–5471 proceeding, would result in the allocation of 66.72% to jurisdictional peak demand. The 1955 peak period has been used for allocation of demand here.

The peak day periods used in determining allocations of demand costs in Docket Nos. G–11982, G–17218 and G–19984, while varying substantially from the relative levels of jurisdictional and nonjurisdictional peak demands utilized in determining Docket No. G–5471 rates, are very close to each other. This is apparent, when the 76.4917% of jurisdictional peak demand for the 1958 peak period (used in Docket No. G–11982) is compared with the 75.3789% of jurisdictional peak demand in the 1959 peak period (used in Docket No. G–17218) and 76.46% in 1960 (used in Docket No. G–19984).

Rates and Refunds in Docket No. G–5471

The period covered by suspension in Docket No. G–5471 extends from December 15, 1954 through July 13, 1957. Natural gas was delivered by Alabama-Tennessee to jurisdictional customers under Alabama-Tennessee's G–1 and SG–1 Rate Schedules through the whole of such period. Gas was also delivered to jurisdictional customers under the Alabama-Tennessee TPS–G–1 Rate Schedule which became effective as of December 29, 1955 and continued in effect until April 30, 1956, as well as under Alabama-Tennessee's I–1 Rate Schedule (interruptible industrial gas) from April 12, 1957 through July 13, 1957.

As previously stated the reasonableness of the rates charged by Alabama-Tennessee to jurisdictional customers during the period when the Docket No. G–5471 rates were in effect have been determined upon the basis of the cost of service showing for the calendar year 1955. If it had been possible to dispose of the Docket No. G–5471 proceeding expeditiously after the rates became effective subject to refund, the G–1 and SG–1 rates would, (under normal conditions) have been tested on the basis either of a 1955 test year, or of a 1954 test year, adjusted as to volumes and cost, to show the changes in these two categories which had occurred or were expected to occur during the year 1955. The TPS G–1 Rate Schedule of Alabama-Tennessee which were effective from December 29, 1955 to April 30, 1956 (although no gas had been delivered under this said schedule prior to January 31, 1956 at the very earliest), and the I–1 Rate Schedule which did not become effective until April 12, 1957, obviously did not result in any deliveries during the year 1955. For reasons which will hereafter be stated, this fact is immaterial to our determination of proper rates for the period between December 15, 1954 and July 13, 1957, when Docket No. G–5471 rates were in effect.

Modifications of the cost of service studies presented in evidence, which modifications have heretofore been discussed and explained, result in showing the jurisdictional cost of service of Alabama-Tennessee in 1955 to be approximately $1,773,735 of which some $835,924 is chargeable to demand and $937,811 to commodity. In order to assign a proper portion of the demand to the Rate Schedule SG–1 customers a computation has been made upon the basis of 1955 for said rate schedule SG–1.

As a result of the computation made on the basis of the 1955 test year it has been determined that the demand charge of $2.70 per Mcf to the Rate Schedule G–1 customers is not unreasonable or discriminatory. It may be noted that the Docket No. G–5471 filing did not increase the monthly demand charge

for Rate Schedule No. G–1 customers. Previous to December 15, 1954, there appears to have been a noticeable although not large tilt in favor of commodity as against demand. The Docket No. G–5471 rate, as filed, did not entirely eliminate this tilt although it did eliminate the greater portion thereof. Since no increase in the demand rate is involved in the Docket No. G–5471, filing, and the previous tilt is considerably reduced thereby, it does not appear desirable to reduce this rate below that previously in effect as the result of a settlement approved by this Commission March 11, 1954, even if such reduction were possible in a Section 4(e) proceeding.

The computations which have been made, on the basis of the 1955 test year, show that the commodity rate of 23.15¢ proposed by Alabama-Tennessee in its Docket No. G–5471 rate increase application is unreasonable and excessive. These computations indicate that a commodity rate of 21.7¢ per Mcf for sale of gas to jurisdictional customers of Alabama-Tennessee's Rate Schedule G–1 constitutes a reasonable and proper charge and allows adequate compensation to Alabama-Tennessee for the service rendered by it.

Upon the basis of the 45% load factor for Rate Schedule SG–1 rates of Alabama-Tennessee that has heretofore been determined, more than $63,000 of the total demand charge paid by Alabama-Tennessee should be assigned to the Rate Schedule SG–1 deliveries made by Alabama-Tennessee during that year. The resultant figure obtained by the addition of such portions of demand charge to the commodity charge for 3,723,779 Mcf of natural gas delivered to said Rate Schedule SG–1 customers, would result in rates to such customers of 41.5¢ per Mcf of all gas purchased by them from Alabama-Tennessee.

Upon the basis of the modification which it has been necessary and desirable to make to the cost of service studies presented in these consolidated proceedings for the year 1955, and the computations made thereon, it has been determined that Alabama-Tennessee's proposed Rate Schedule SG–1 rate of 42.65¢ per Mcf for the period December 15, 1954 through July 13, 1957 is excessive and unreasonable. It further appears that a rate of 41.5¢ per Mcf for all gas sold under the SG–1 Rate Schedule of Alabama-Tennessee during the period, when the Docket No. G–5471 rates were in effect subject to refund, is reasonable and is compensatory to Alabama-Tennessee.

During that portion of period covered by the Docket No. G–5471 rates, which extended from December 29, 1955 through April 30, 1960, the temporary service rate, designated as Alabama-Tennessee's TPS–G1 Rate Schedule was available to Alabama-Tennessee's jurisdictional customers, who were purchasing gas under Alabama-Tennessee's GS–1 Rate Schedule. Only three of the said customers availed themselves of the TPS–G1 service. The said TPS–G1 rate was in effect for approximately four months and has heretofore been discussed. It does not appear that rates charged to the three customers who purchased gas under the TPS G–1 Rate Schedule were in any way unreasonable. On the other hand the rates do not appear to have been unfair to other customers. The total gas purchased under the said Rate Schedules TPS–G1 amounted to 488 Mcf, which is less than one ten-thousandth, or one one-hundredth of one percent, of all the gas sold to jurisdictional customers by Alabama-Tennessee during the calendar year 1956. It has heretofore been determined that the said TPS–G1 Rate Schedules of Alabama-Tennessee, in effect from December 29, 1955 through April 30, 1956 is not unreasonable or discrimatory.

On March 1, 1947, for the first time, Alabama-Tennessee filed an interruptible industrial rate schedule designated as its FPC Rate Schedule I–1. In accordance with a request of Alabama-Tennessee, temporary authority was granted (in Docket No. G–12263) to make a sale under said I–1 Rate Schedule to Muscle Shoals Natural Gas Corporation (Muscle Shoals), one of the existing Rate Schedule G–1 customers of Alabama-Tennessee. In a letter notifying

Alabama-Tennessee of the temporary authorization for the sale to Muscle Shoals it was provided that Rate Schedule I–1, tendered on April 1, 1957, should be subject to refund in Docket No. G–11982. In view of the fact that industrial rate schedules are not subject to suspension, and the language in the letter of temporary authorization, issued by the Secretary of this Commission relating the said I–1 Rate Schedule to Docket No. G–11982 rates, which had been filed on January 14, 1957, approximately one and one-half months prior to the tendering of the I–1 Rate Schedule and which were (at the time of the temporary authorization) in suspension to July 14, 1957, the I–1 Rate Schedule (as filed March 1, 1957) will be fully discussed in connection with Docket No. G–11982 rates The fact that such rate schedule exceeds by 3.4¢ per Mcf the commodity rates found unreasonable for Rate Schedule G–1 customers during Docket No. G–5471 period is therefore immaterial here.

The rate schedules for both demand and commodity, applicable to the Docket No. G–5471 period on the basis of the test year, have been checked against the 12-month period ending December 31, 1956 and the 6-month period ending June 30, 1957, to determine whether the said rates are equitable to both the customers and the company.

When related to the volumes of natural gas delivered during the periods in question, the excess amounts of such rates, which were collected subject to refund for the 1956 and 1957 periods to which the G–5471 rates were applicable (except that portion of the latter period from July 1 through 13, 1957) is within a tenth of one percent in each case of the excess shown for the test year.

The excess shown for 1956 is $70,183, as related to a total volume of 4,913,698 Mcf, and the excess shown for the first six months of 1957 is $40,138, as related to a total volume of 2,817,462 Mcf, as compared to $60,367, related to a total volume of 4,321,800 Mcf in the 1955 test year. Volumes delivered under the TPS–G1 Rate Schedule in 1956 and under the I–1 Rate Schedule in the 1957 half-year period are not included in the volumes used in this calculation.

Volumes and revenues for the period from December 15, 1954 through December 31, 1954 are not available in any of the exhibits placed in evidence. For the period July 1, 1957 to July 13, 1957 it is possible to compute the jurisdictional volumes by using Exhibit No. 21 presented by Alabama-Tennessee. The said exhibit No. 21 does not contain any breakdown of sales between the G–1 and SG–1 Rate Schedules of Alabama-Tennessee. For all practical purposes it is impossible to determine what excess has been collected by Alabama-Tennessee during the two short periods in December 1954 and July 1957 discussed above.

We are hereafter provided for refund in Docket No. G–5471 based upon the G–1 commodity rate of 21.7¢ and the SG–1 rate of 41.5¢. This results in a refund of 1.45¢ per Mcf to Rate Schedule G–1 customers and a refund of 1.15¢ per Mcf to Rate Schedule SG–1 customers. In computing the amounts to be refunded to each class of customers, it will be necessary for Alabama-Tennessee to determine the additional refunds due for the periods in December 1954 and July 1957 for which figures were not available in the record.

Rates and Refunds in Docket No. G–11982

For the locked-in period beginning July 14, 1957 and ending May 14, 1959, during which the rates filed by Alabama-Tennessee in Docket No. G–11982 were being collected subject to refund, the said rates as proposed by Alabama-Tennessee were a Rate Schedule G–1 rate having a demand element of $2.90 per month and a commodity element of 25.05 cents for Mcf, an SG–1 Rate

Schedule of 46.75 cents per Mcf and an I–1 Rate Schedule of 25.1 cents per Mcf. As previously stated these rates have been tested against cost-of-service studies for the calendar year 1958, adjusted in conformity with the various changes in such cost studies which have been heretofore stated to be necessary, and which have been discussed herein.

Computations, made upon the basis of the cost of service for 1958, show that the demand charge of $2.90 per month proposed by Alabama-Tennessee would result in an indicated excess of actual revenues over cost of service and would be unreasonable. As previously stated, Alabama-Tennessee and all of its jurisdictional customers, except the City of Corinth, arrived at a settlement agreement on the basis of a $2.70 demand charge in Docket No. G–11982. A study of the actual revenues collected by Alabama-Tennessee during the calendar year 1958, and of the cost of service related to demand and commodity, shows that the $2.70 rate (if also applied on the 45% load factor basis to the SG–1 Rate Schedule) would shortchange demand in favor of commodity by more than $40,000 during the year. Alabama-Tennessee had indicated, however, its willingness to accept the $2.70 rate, by filing such rate as its demand rate in its next rate increase application in Docket No. G–17218, at a time when its total costs had been increased. Any deficiency of course would be chargeable to commodity, if Alabama-Tennessee is to recoup its cost of service. It does not appear that the charging of the deficiency involved here to commodity would be unfair or inequitable to the customers of Alabama-Tennessee. As a result of the computations necessary to create rates which will compensate Alabama-Tennessee adequately and at the same time provide reasonable rates to Alabama-Tennessee's utility customers, it has been determined that a commodity rate of 24.2¢ for the Rate Schedule GS–1 customers of Alabama-Tennessee is reasonable and appropriate. It has also been determined that a rate of 43.9¢ per Mcf for Rate Schedule SG–1 customers, during the period from July 14, 1957 through May 14, 1959, is reasonable and appropriate.

From the finding that the lower rates discussed above are reasonable, it necessarily follows that the demand rate of $2.90 originally sought by Alabama-Tennessee for Rate Schedule G–1 customers in Docket No. G–11982, as well as the commodity rate of 25.05 cents proposed for such customers in the rate-increase application in Docket No. G–11982 are found not to be reasonable. This also applies to the rate of 46.75 cents per Mcf sought in this rate-increase application for the sale of gas by Alabama-Tennessee to its SG–1 customers.

The Rate Schedule I–1 rate of 25.1 cents per Mcf, which was made effective April 12, 1957 (some three months prior to the date when the other G–11982 rates became effective subject to refund) appear to be a reasonable rate, if the rates of Tennessee in its Docket No. G–11980 are not hereafter reduced. Since the differential between the commodity charge to Alabama-Tennessee's Rate Schedule G–1 customers is only nine-tenths of a cent less than the charge to the Rate Schedule I–1 customers, it would appear desirable, if the rates paid by Alabama-Tennessee to Tennessee are hereafter substantially reduced, to make some adjustment in the differential between the Rate Schedule I–1 rate and the commodity factor of the Rate Schedule G–1 rate. In order that the Commission may hereafter have the unquestioned right to make some adjustment of the said differential it is hereinafter provided (in the event that refunds are made by Tennessee to Alabama-Tennessee under Tennessee's Docket No. G–11980) that the right is reserved to the Commission to so adjust any refunds that Alabama-Tennessee may be directed to make to its customers, because of refunds made by Tennessee in Docket No. G–11980, that such differential may be increased to not more than 2-cents per Mcf.

In order to test the reasonableness of the rates developed in Docket No. G–11982 by the use of the test year 1958, the volumes delivered to G–1 and SG–1 customers during the period from July 14, 1957 through December 31, 1957 and the period from January 1, 1959 through May 14, 1959 have been checked against the indicated excess revenues for the said 1957 and 1958 periods. In the case of the 1958 period such a check shows that the variance, as between the 1957 and 1958 segments of the locked-in period covered by Docket No. G–11982 rates, amounting to less than one-tenth of one cent per Mcf. In the case of the 1959 segment of the said locked-in period, it appears that there is an actual variance of approximately two-tenths of a cent per Mcf between the 1958 and 1959 segments of the overall locked-in period.

It may be noted here that in the case of the I–1 rate, which has not been found to be unreasonable, the rate has, as previously stated, been declared to be in effect as part of the Docket No. G–11982 rates, from the time of its original filing even though it thus became effective some three months prior to the effective date when the G–1 and SG–1 rates, proposed in Docket No. G–11982, began to be collected subject to refund. These is a slight element of balancing in the fact that approximately three months of the supply of gas utilized for the said Rate Schedule I–1 sales were paid for at Tennessee's rates as they existed prior to July 14, 1957. Howover, the volumes sold under this rate schedule prior to July 14, 1957 amount to only 24,008 Mcf as against 386,586 Mcf sold under the I–1 Rate Schedule between July 14, 1957 and May 14, 1959.

The reduction in the G–1 and SG–1 rates for the Docket No. G–11982 locked-in period makes it necessary to direct the refunding by Alabama-Tennessee to its utility customers of any sums collected from said customers in excess of the rates herein determined to be just and reasonable. Such excess amounts to 20 cents per Mcf of billing demand and .85 of a cent per Mcf of commodity in the case of the G–1 rate, and 2.85 cents per Mcf delivered by Alabama-Tennessee to its Rate Schedule SG–1 customers during the said locked-in period. No refund is presently required in the case of Rate Schedule I–1 gas sold by Alabama-Tennessee in the period covered by Docket No. G–11982 rates. The possibility of further refunds remains, in the event that Tennessee makes refunds to Alabama-Tennessee in Docket No. G–11980.

Rates and Refunds in Docket No. G–17218

As previously stated, the test year 1959 was used for the determinations of rates to be charged by Alabama-Tennessee during the locked-in period covered by Docket No. G–17218. In order to properly and equitably determine the required revenues for the test year 1959 applicable to the said Docket No. G–17218 rates, it was necessary to adjust the cost of purchased gas for the portion of the year 1959 ending on May 14, of that year to reflect the theoretical impact of the increased prices charged by Tennessee for such gas after May 15, under Tennessee's Docket No. G–17166 if such increased prices had been in effect throughout the whole year. As adjusted to reflect the impact of the increased rates of Tennessee paid by Alabama-Tennessee in the period prior to May 15, 1959, the said cost of service amounts to approximately $3,443,972 as against actual revenues collected during the said test year of $3,427,938. The fact that the actual revenues are less than the cost of service is due, however, to the fact that the actual revenues for the period of approximately 4½ months before the Docket No. G–17218 rates became effective subject to refund were paid upon the basis of the earlier rates being collected subject to refund in Docket No. G–11982. Computations based upon the deliveries of Rate Schedule G–1 gas and the billing demand for such gas show that a considerable excess

would have been collected if both the Docket No. G–17218 rates of Alabama-Tennessee and the Docket No. G–17166 rates of Tennessee had been effective throughout the entire 1959 test year.

Computations made upon the basis of an adjustment for the period between January 1 and May 14, 1959 have resulted in the development of a rate of 27.9¢ per Mcf as the proper commodity charge for gas delivered to Alabama-Tennessee's utility customers under its Rate Schedule G–1. The $2.70 per month demand charge is in fact a decrease rather than as increase from the rates previously being collected by Alabama-Tennessee subject to refund, under its Docket No. G–11982 rate schedules. While this rate appears to result in collection of demand charges in excess of those actually shown by the annual cost of service figures for 1959 (as adjusted), there is nothing that can be done at this time to reduce the said $2.70 per month demand charge. The figures developed, however, for the test year in regard to commodity indicate that the commodity charges proposed by Alabama-Tennessee for its sales to Rate Schedule G–1 customers and Rate Schedule SG–1 customers in the Docket No. G–17218 filings are unreasonable and should be reduced.

Comparison of the actual revenues with the delivery volumes for the various classes of sales made by Alabama-Tennessee under its several rate schedules indicate that a reasonable charge for the commodity element of the gas sold under the Rate Schedule G–1 of Alabama-Tennessee, during this period, is 27.9¢ per Mcf. Computations made on the basis of an assumed 45% load factor for Alabama-Tennessee's Rate Schedule SG–1 customers indicate that 47.6¢ per Mcf constitutes a reasonable rate for such sales. Since the rate proposed by Alabama-Tennessee in Docket No. G–17218 for sales to Rate Schedule I–1 customers of 28.3¢ per Mcf is only four-tenths of a cent per Mcf higher than the commodity portion of the corresponding G–1 rate, it appears that the said Rate Schedule I–1 rate of 28.3¢ is not unreasonably high. This Commission is not authorized to increase rates in a Section 4(e) hearing. It must be found that, under the present circumstances and in the absence of any reduction in the commodity rate of Tennessee in its Docket No. G–17166, the said 28.3¢ rate of Alabama-Tennessee for gas sold under its Rate Schedule I–1 rate during the locked-in period covered by Docket No. G–17218 is a reasonable rate.

On the basis of the rates arrived at by the computations discussed herein, it appears that Alabama-Tennessee should refund to Rate Schedule G–1 customers eight-tenths of one cent per Mcf for all gas delivered under its G–1 Rate Schedule during the period from May 15, 1959 through April 4, 1960. Alabama-Tennessee should also refund 1.1 cent per Mcf to its Rate Schedule SG–1 customers for all gas sold and delivered to such customers during the same period. For reasons heretofore stated no refunds are due upon the basis of the demand component of the Docket No. G–17218 rates of Alabama-Tennessee nor upon the Rate Schedule I–1 rates of Alabama-Tennessee for the same period. In the event that refunds may hereafter be ordered paid by Tennessee to Alabama-Tennessee under Tennessee's Docket No. G–17166, it is possible that the resultant additional refunds made by Alabama-Tennessee to its customers may be adjusted to provide a differential, not exceeding 2¢ per Mcf of the Rate Schedule I–1 rate of Alabama-Tennessee over the commodity component of the Rate Schedule G–1 rate and the portions of the SG–1 rate of Alabama-Tennessee represented by the inclusion of a demand element of a load factor basis.

Comparison of the adjusted test year 1959 figures with the volumes and revenues actually received during the period between May 15, 1959 and March 31, 1960 do not show any variations from the test year which would

materially affect the interests of either Alabama-Tennessee or its utility customers. No figures are available in the record for the period from April 1 to April 4, 1960 and it is assumed therefore that such figures would not materially alter the situation. In any event the effect of any changes during such a four-day period would be minimal.

Refunds and Future Rates in Docket No. G–19984

In the case of the rate increase application proceeding in Docket No. G–19984, rates must be determined for a period beginning April 5, 1960, and extending through a future period, the length of which has not yet been determined. In doing this, it will be necessary to determine the basis upon which refunds (if any are required) should be made by Alabama-Tennessee to various classes of jurisdictional customers of excess charges for gas previously paid for by the said customers. In addition the machinery must be put in motion for the filing, if necessary, of such new rates as may be found to be reasonable for the future sale of natural gas by Alabama-Tennessee to its its jurisdictional customers.

For this purpose, Exhibit No. 45 (presented in evidence by the intervener-Municipal Association) has been utilized as the basic source of volumes, revenues and cost of service information. Necessary adjustments have been made to correctly reflect the determinations herintofore made in regard to regulatory costs and various other matters. The accuracy of figures used in the intervener's exhibit have also been checked against other exhibits and other documents which may be part of the record and which form a part of the general knowledge and expertize available to the presiding officer and to the Commission. The future demands of Alabama-Tennessee's utility customers as well as the comparative future demands of its direct industrial customers are not known and must be necessarily estimated. This is also true as to the continuance of future variations in the level of various items entering into the cost of service by Alabama-Tennessee. For this reason the element of judgment on the part of the presiding officer and of the Commission, in the fixing of the future rates which are a part of the Docket No. G–19984 determination is more important than in the case of the other three proceedings, where the costs (with the possible exception of future refunds from Tennessee) may be determined with a degree of definiteness impossible in estimates made for the future.

Exhibit No. 45 shows that during the year ending March 31, 1960, which is the latest available period of 12 months for which figures appear in the record, Alabama-Tennessee sold to its various jurisdictional customers 7,706,375 Mcf of natural gas. Of this amount 6,979,604 Mcf were sold to Rate Schedule G–1 customers, 449,067 Mcf were sold to SG–1 customers and 277,704 Mcf were sold and delivered to Rate Schedule I–1 customers. The billing demands of the Rate Schedule G–1 customers during this period appear to have amounted to 531,654 Mcf. A billing demand of 32,809 Mcf has been allocated to the SG–1 customers under the 45% load factor formula used in determining the rates applicable to the sales to such customers.

It has been determined by computation that, upon the basis of the sales during the year ending March 31, 1960, the commodity rate applicable to Rate Schedule G–1 sales and the rates at which gas is proposed to be sold to SG–1 customers by Alabama-Tennessee in its Docket No. G–19984 rate increase application are not reasonable. It has been further determined by computation that 26.5¢ per Mcf is a reasonable rate for the commodity element in the sale to Alabama-Tennessee's Rate Schedule G–1 customers and that 51.9¢ per Mcf is a reasonable rate for the sale of natural gas to Alabama-Tennessee's

SG–1 customers. Since the I–1 rate of 28.3¢ per Mcf is 1.8¢ per Mcf higher than the commodity portion of the Rate Schedule G–1 rate of Alabama-Tennessee as computed, such proposed I–1 rate (which incidentally does not constitute an increase over the previously collected Docket No. G–17218 rate for such sales) appears to presently constitute a reasonable rate.

The increased costs of gas from Tennessee to Alabama-Tennessee which are the basis of the proposed increases of Alabama-Tennessee in Docket No. G–19984 consists solely of an increase of 85¢ per month in the billing demand charge. It has been determined by computation based upon the figures for the year ending March 31, 1960, that a reasonable rate for the demand factor of the Rate Schedule G–1 rate is $3.48. This is 7¢ per month less than the increased proposed and being collected subject to refund by Tennessee from Alabama in Docket No. G–19983. It has been possible because of the increased demand charges to reduce the commodity charge under the Rate Schedule G–1 rate in the Docket No. G–19984 period 1.4¢ per Mcf below the rate which has been found to be the reasonable rate for the commodity factor of the Rate Schedule G–1 rate in Docket No. G–17218.

The 45% load factor for Rate Schedule GS–1 customers has been retained, because this seems to be an equitable load factor for this group of customers and to have, in the past, induced the growth of the demands of such customers, with an orderly relation between peak and average demands. This appears to have operated to the advantage of both Alabama-Tennessee and its utility customers.

It is entirely possible that, if it is hereafter determined in Docket No. G–19983 that the rates charged by Tennessee to Alabama-Tennessee should be reduced for the future and that refunds should be made by Tennessee to Alabama-Tennessee for some portion of the rates now being collected subject to refund by Tennessee in Docket No. G–19983, the Rate Schedule G–1 rate of Alabama-Tennessee (as hereinbefore determined) may cease to be a reasonable rate. Such unreasonableness, if hereafter found to exist because of a reduction in the rates charged by Tennessee to Alabama-Tennessee, will necessarily also affect the reasonableness of the Rate Schedule SG–1 rate of Alabama-Tennessee, because the said SG–1 rate includes a demand element computed on the basis of a 45% load factor. If any reductions are hereafter required from Tennessee under the Docket No. G–19983 rates of that company or the prior rates charged to Alabama-Tennessee under rate schedules filed in Tennessee's Dockets No. G–5259, G–11980, G–17166 it is possible that the rates being charged for commodity to Alabama-Tennessee's Rate Schedule G–1 customers and the rates charged to Rate Schedule I–1 customers may thereafter become unreasonable and reductions in such rates may also hereafter be required by this Commission.

For the present, and in the absence of any reduction in the rates charged by Tennessee to Alabama-Tennessee, it has been determined that Alabama-Tennessee should refund to its Rate Schedule G–1 customers seven cents for each Mcf of billing demand with which customers have been charged since April 5, 1960, and which they have paid to Alabama-Tennessee and 1.9 cents for each Mcf of natural gas, as a commodity, paid by the said Rate Schedule G–1 customers at the 28.7 cents per Mcf rate which was also made effective April 5, 1960. It has been determined that for each Mcf of gas sold and delivered under the rates to SG–1 customers made effective April 5, 1960, Alabama-Tennessee should refund 10.1 cents, thus affecting a reduction in rate, from the 62 cents rate collected from such customers since April 5, 1960, to 51.9 cents per Mcf. No refund is presently required in the case of the Rate Schedule I–1 customers.

It has also been determined that Alabama-Tennessee shall and must file new rates for the sale of natural gas to its Rate Schedule G–1 customers in the amount of $3.48 of billing demand and 26.5 cents per Mcf of gas sold. Alabama-Tennessee shall also file new rates providing for the sale of natural gas to its SG–1 customers in the future at 51.9 cents per Mcf.

The increase in the demand rates of Tennessee contained in Tennessee's rate increase proposal, designated by this Commission as Docket No. G–19983 has resulted in a proposal by Alabama-Tennessee, in its proposed rates and charges considered in Docket No. G–19984, to increase its demand charge to its Rate Schedule G–1 customers by 85 cents per Mcf of billing demand to a total billing demand charge of $3.55 per Mcf monthly. The only other increase in billing demand involved in these four consolidated proceedings was that contained in Alabama-Tennessee's rate case filing designated as Docket No. G–11982.

In the case of Docket No. G–11982, Alabama-Tennessee reached an agreement with all of its jurisdictional customers except the City of Corinth, which agreement, not being unanimous, was not considered by this Commission. Alabama-Tennessee did, however, in its next rate increase filing (designated as Docket No. G–17218) propose to revert to the previous demand charge of $2.70 per month per Mcf of billing demand. This maintenance by Alabama-Tennessee, of the $2.70 per month demand charge, in spite of Tennessee's increase of 20 cents per month in its demand charge (as proposed in Tennessee's Docket No. G–11980 rate-increase application and collected by Tennessee from Alabama-Tennessee since July 14, 1957), has had the effect of reversing to some extent the tilt in favor of commodity as against demand, contained in Alabama-Tennessee's Rate Schedule G–1 rate prior to July 14, 1957. The subsequent filing of Alabama-Tennessee of the Docket No. G–17218 rates, which became effective May 15, 1959, further accentuated this change and resulted in an obvious tilt in favor of demand as against commodity in the G–1 rates of Alabama-Tennessee. Since, the SG–1 rate contains an arbitrary factor for demand based on an assumed 45 percent load factor, this rate (for each of the Docket Nos. G–11982 and G–17218 locked-in periods) reflects some of the increasing tilt toward demand as opposed to commodity which appears in the G–1 rates for the same period.

The proposal (designated as Docket No. G–19984) of Alabama-Tennessee to increase the demand portion of its G–1 rate by an amount equivalent to the increase of the demand portion of Tennessee's rate sought by that company in Docket No. G–19983, has permitted the making of an actual decrease in the allowed commodity rate of Alabama-Tennessee for the period, beginning April 5, 1960. This also has the effect of holding the increase in the SG–1 rate after April 5, 1960 to a minimal figure and increasing the margin between the Rate Schedule I–1 rate and the commodity portion of the G–1 rate. Both of the last mentioned effects improve the general balance of the rate structure of Alabama-Tennessee.

Further Findings and Conclusions

Upon consideration of the record made in these consolidated proceedings, including the pleadings, and the briefs and argument of counsel it is further found and concluded that:

(1) The proposed increased commodity rates contained in Alabama-Tennessee's First Revised Sheet No. 5 and in its First Revised Sheet No. 10 to its FPC Gas Tariff, First Revised Volume 1, filed November 5, 1954 and effective, subject to refund, from December 15, 1954 to July 13, 1957, are unjust, unreasonable, unduly discriminatory or preferential, or otherwise unlawful and should be disallowed.

(2) The lawful rates and charges of Alabama-Tennessee for the commodity portion of the sale of natural gas to its Rate Schedule G–1 customers, subject to the jurisdiction of this Commission, for the period from December 15, 1954 through July 13, 1957 are 21.7 cents per Mcf or 1.45 cents per Mcf less than the rates and charges for the commodity portion of such service proposed in its First Revised Sheet No. 5 tendered for filing November 5, 1954.

(3) The lawful rates and charges of Alabama-Tennessee for sales of natural gas under its Rate Schedule No. SG–1, subject to the jurisdiction of this Commission, for the period December 15, 1954 through July 13, 1957 are 41.5 cents per Mcf or 1.15 cents per Mcf less than the proposed rate filed by Alabama-Tennessee, contained in its First Revised Sheet No. 10 of its FPC Gas Tariff First Revised Volume No. 1 for the period from December 15, through July 13, 1957.

(4) The rates and charges included in Original Sheets Nos. 8A, 8B, 8C, and 8D, filed December 29, 1955 and constituting Alabama-Tennessee's Rate Schedule TPS–G1, being part of its FPC Gas Tariff First Volume No. 1 and providing for temporary firm peak service to be effective from December 29, 1955 through April 30, 1956, are just and reasonable and not unduly discriminatory or preferential or otherwise unlawful.

(5) If and in the event that the rates and charges made by Alabama-Tennessee under the proposed increased rates filed by Tennessee in Docket No. G–5259 should hereafter be found to be unjust, unreasonable, unduly discriminatory or preferential or otherwise unlawful and are disallowed in whole or in part and refunds made by Tennessee to Alabama-Tennessee in accordance with such whole or partial disallowance, then and in that event the increased rates included in Alabama-Tennessee's First Revised Sheets Nos. 5 and 10 to its FPC Gas Tariff Volume No. 1 may become unjust, unreasonable, unduly discriminatory or preferential to an extent greater than that found in Findings 2 and 3 above and further and additional refunds by Alabama-Tennessee to its jurisdictional customers may be required.

(6) The proposed rates and charges contained in Alabama-Tennessee's Third Revised Sheet No. 5 and Second Revised Sheet No. 10 to its FPC Gas Tariff First Revised Volume No. 1 tendered for filing on January 14, 1957 and made effective, subject to refund, as of July 14, 1957 are unjust, unreasonable, unduly discriminatory or preferential or otherwise unlawful and should be disallowed.

(7) The lawful rates and charges of Alabama-Tennessee for sale of natural gas to its G–1 customers, subject to the jurisdiction of this Commission, for the period from July 14, 1957 through May 14, 1959 are the proposed increased rates and charges, reduced from $2.90 per Mcf of billing demand to $2.70 per Mcf of billing demand or 20 cents per Mcf of billing demand, and the lawful rates and charges for commodity to said customers are the proposed increased rates, reduced from 25.05 cents per Mcf to 24.2 cents per Mcf, or .85 cents per Mcf for the period from July 14, 1957 through May 14, 1959. And the lawful rates and charges for the same period to the SG–1 customers of Alabama-Tennessee are the proposed increased rates, reduced from 46.75 cents per Mcf, to 43.9 cents per Mcf or a 2.85 cents per Mcf reduction thereof.

(8) The proposed increased rates and charges contained in Alabama-Tennessee's Original Sheet No. 11D to its FPC Gas Tariff, First Revised Volume No. 1 tendered for filing on March 1, 1957 and effective, subject to refund, from April 21, 1957 through May 14, 1959 are not unjust, unreasonable, unduly discriminatory or preferential or otherwise unlawful.

(9) In the event that Tennessee's rate increases proposed in Docket No. G–11980 which were effective, subject-to refund from July 14, 1957 through May 14, 1959 are hereafter found to be unjust, unreasonable, unduly dis-

criminatory or preferential or otherwise unlawful and that refunds of all or a portion of such increases are made by Tennessee to Alabama-Tennessee, then it is possible that all or part of the remaining proposed increased rates and charges of Alabama-Tennessee under Docket No. G–11982, collected from customers of Alabama-Tennessee subject to refund, may hereafter be found to be unjust, unreasonable, unduly discriminatory or preferential or otherwise unlawful and should be disallowed, and, in that event, some further refunds by Alabama-Tennessee to its various classes of customers for the period when rates proposed in Docket No. G–11982 have been effective and collected by Alabama-Tennessee from said customers subject to refund, may be required.

(10) The proposed increased rates and charges contained in Alabama-Tennessee's Fourth Revised Sheet No. 5 and Fifth Revised Sheet No. 10 to its FPC First Revised Volume No. 1, tendered for filing November 14, 1958 and made effective, subject to refund, as of May 15, 1959 and continued in effect until April 4, 1960 are unjust, unreasonable, unduly discriminatory or preferential, or otherwise unlawful and should be disallowed.

(11) The lawful rates and charges of Alabama-Tennessee for sales of natural gas, subject to the jurisdiction of this Commission, to Alabama-Tennessee's G–1 and SG–1 customers for the period May 15, 1959 to April 4, 1960 are the rates and charges proposed in the Docket No. G–17218 rate increase application, reduced by eight-tenths of a cent per Mcf in the case of G–1 customers and 1.1 cents per Mcf in the case of SG–1 customers.

(12) The proposed increased rates and charges contained in the First Revised Sheet No. 11D of Alabama-Tennessee's FPC Gas Tariff First Revised Volume No. 1, which became effective as of May 15, 1959, are hereby found not to be unjust, unreasonable, unduly discriminatory or preferential to Alabama-Tennessee's I–1 customers for the period extending from May 15, 1959 into the future and should not be disallowed, in the absence of any refund from Tennessee to Alabama-Tennessee for gas sold and delivered by Tennessee to Alabama-Tennessee during the said period.

(13) The rates and charges of Alabama-Tennessee to its I–1 customers during the period beginning May 15, 1959 may become unjust, unreasonable, unduly discriminatory or preferential or otherwise unlawful, if refunds are hereinafter ordered to be paid by Tennessee to Alabama-Tennessee in substantial amounts, for gas sold and delivered during the said period.

(14) The rates and charges of Alabama-Tennessee for service of Alabama-Tennessee's Rate Schedule G–1 and Rate Schedule SG–1 which are found to be presently lawful for the period from May 15, 1959 to April 4, 1960 in Finding (11) may hereafter become unjust, unreasonable, undully discriminatory, or preferential, or otherwise unlawful and subject to disallowance, in the event that substantial refunds are required to be made by Tennessee to Alabama-Tennessee for the service rendered to Alabama-Tennessee during the said period, under increased rates, subject to refund by order of this Commission issued in Docket No. G–17166.

(15) The proposed increased rates and charges contained in Alabama-Tennessee's Fifth Revised Sheet No. 5 and Sixth Revised Sheet No. 10 to its FPC Gas Tariff First Revised Volume No. 1, tendered for filing on October 5, 1959 and effective, subject to refund as of April 5, 1960 are unjust, unreasonable, unduly discriminatory or preferential, or otherwise unlawful and should be disallowed.

(16) The presently lawful rates and charges of Alabama-Tennessee for sale of natural gas, subject to the jurisdiction of this Commission under Alabama-Tennessee's Rate Schedules Nos. G-1 and SG-1 for the period beginning April

5, 1960 are $3.48 per Mcf of billing demand and 26.5 cents per Mcf or 7 cents per Mcf of billing demand and 2.2 cents per Mcf of natural gas less than the rates proposed by Alabama-Tennessee in Docket No. G–19984, in the case of Rate Schedule G–1 customers, and 51.9 cents per Mcf, or 10.1 cents per Mcf of natural gas less than the rates proposed by Alabama-Tennessee in Docket No. G–19984, in the case of the SG–1 customers.

(17) In the event that the rates and charges of Tennessee to Alabama-Tennessee proposed in Docket No. G–19983 by Tennessee are hereafter found to be unjust, unreasonable, unduly discriminatory or preferential or otherwise unlawful and that such proposed rates of Tennessee are wholly or partially disallowed and substantial refunds by Tennessee to Alabama-Tennessee are hereafter paid, the presently lawful rates and charges of Alabama-Tennessee, discussed in the above Finding, may become unjust, unreasonable, unduly discriminatory or preferential or otherwise unlawful and further portions thereof should be disallowed.

(18) The motion of the Municipal Association to dismiss the four rate filings of Alabama-Tennessee under consideration in these consolidated proceedings on the ground that such filings are not authorized by the terms of the various service agreements between Alabama-Tennessee and its various distributors who are members of the said Municipal Association has not been shown to be justified and should be denied.

WHEREFORE, IT IS ORDERED, subject to review by the Commission that:

(A) The proposed increased rates and charges set forth in Alabama-Tennessee's First Revised Sheets Nos. 5 and 10 to its FPC Gas Tariff, First Revised Volume No. 1 for the period from December 15, 1954 through July 13, 1957, are hereby disallowed.

(B) Alabama-Tennessee shall, within sixty days of the time when this Decision becomes the official action of this Commission, refund to its G–1 customers, with interest at the rate of 6 percent per annum from the date of payment to Alabama-Tennessee to the date of refund, the excess of the total amounts charged and collected for sales made on and after December 15, 1954 through July 19, 1957, over the total amount which would have been charged to such customers under the lawful rates set forth in Finding (2) of this Decision, and Alabama-Tennessee shall bear the costs of such refunds.

(C) Alabama-Tennessee shall, within sixty days of the time when this Decision becomes the official action of this Commission, refund to its SG–1 customers, with interest at the rate of 6 percent per annum from the date of payment to Alabama-Tennessee to the date of refund, the excess of the total amounts charged and collected for sales made on and after December 15, 1954 through July 13, 1957, over the total amount which would have been charged to said customers under the lawful rates set forth in Finding (3) of this Decision, and Alabama-Tennessee shall bear the costs of such refunds.

(D) The proposed increased rates and charges set forth in Alabama-Tennessee's Third Revised Sheet No. 5 and Second Revised Sheet No. 10 to its FPC Gas Tariff, First Revised Volume No. 1 for the period from July 14, 1957 through May 14, 1959, are hereby disallowed.

(E) Alabama-Tennessee shall, within sixty days of the time when this Decision becomes the official action of this Commission, refund to its G–1 customers, with interest at the rate of 6 percent per annum from the date of payment to Alabama-Tennessee to the date of refund, the excess of the total amounts charged and collected for sales made on and after July 14, 1957 through May 14, 1959, over the total amounts which would have been charged to such customers under the lawful rates set forth in Finding (7) of this Decision, and Alabama-Tennessee shall bear the costs of such refunds.

(F) Alabama-Tennessee shall, within sixty days from the time when this Decision becomes the official action of this Commission, refund to its SG–1 customers, with interest at the rate of 6 percent per annum from the date of payment to Alabama-Tennessee to the date of refund, the excess of the total amounts charged and collected for sales made on and after July 14, 1957 through May 14, 1959, over the total amounts which would have been charged to such customers under the lawful rates set forth in Finding (7) of this Decision, and Alabama-Tennessee shall bear the costs of such refunds.

(G) The proposed increased rates and charges contained in Alabama-Tennessee's Fourth Revised Sheet No. 5 and Fifth Revised Sheet No. 10 to its FPC Gas Tariff, Revised Volume No. 1, for the period from May 15, 1959 through April 4, 1960, are hereby disallowed.

(H) Alabama-Tennessee shall, within sixty days from the time when this Decision becomes the official action of this Commission, refund to its G–1 customers and SG–1 customers with interest at the rate of 6 percent per annum from the date of payment to Alabama-Tennessee to the date of refund, the excess of the total amounts charged and collected for sales made on and after May 15, 1959 through April 4, 1960, over the total amounts which would have been charged to such customers (in each case) under the lawful rates set forth in Finding (11) of this Decision and Alabama-Tennessee shall bear the costs of such refunds.

(I) The proposed increased rates and charges contained in Alabama-Tennessee's Fifth Revised Sheet No. 5 and Sixth Revised Sheet No. 10 to its FPC Gas Tariff, First Revised Volume No. 1, for the period beginning April 5, 1960 are hereby disallowed.

(J) Alabama-Tennessee shall, within sixty days from the time when this Decision becomes the official action of this Commission, refund to its G–1 customers and SG–1 customers, with interest at the rate of 6 percent per annum from the date of payment to Alabama-Tennessee to the date of refund, the excess of the total amounts which would have been charged to such customers (in each case) under the lawful rates set forth in Finding (15) of this Decision and Alabama-Tennessee shall bear the costs of such refunds.

(K) The Commission retains jurisdiction over all of the rates being collected subject to refund in Docket Nos. G–5471, G–11982, G–17218 and G–19984, which are not herein ordered to be refunded, until determination of the lawful rates which should be paid by Alabama-Tennessee to Tennessee under the rate increase filings of Tennessee, under consideration in Docket Nos. G–5259, G–11980, G–17166 and G–19983, for the purpose of requiring such further refunds, if any, as may be required to be made by Alabama-Tennessee to its customers, which may result from possible reductions of Tennessee's rates and charges for the sale of gas to Alabama-Tennessee, and the right is reserved to adjust any further refunds by Alabama-Tennessee, which may result from determinations made in regard to the rates and charges of Tennessee, in such manner as to result in a differential not exceeding 2 cents per Mcf between the commodity element of the Rate Schedule G–1 rate and the Rate Schedule I–1 rate of Alabama-Tennessee.

(L) Alabama-Tennessee shall, within thirty days of the time when this Decision becomes the official action of the Commission, file tariff sheets in substitution for Fifth Revised Sheet No. 5 and Sixth Revised Sheet No. 10 of its FPC Gas Tariff, First Revised Volume No. 1, in accordance with the rates and charges found to be reasonable and proper charges in Finding (16) hereof.

(M) Within thirty days after making all the refunds provided for herein, Alabama-Tennessee shall report to the Commission, in writing and under oath, the amount of the refunds made to each of its jurisdictional customers, show-

ing separately the amount of principal and interest so paid, the billing determinants or other basis used for such determination and shall serve a copy of such report upon each of the customers receiving a refund.

(N) The motion of the Municipal Association to dismiss the four rate filings of Alabama-Tennessee under consideration in the consolidated proceedings is hereby denied.

CHAMPLIN OIL & REFINING COMPANY (OPERATOR), *et al.*, DOCKET NO. RI62-194

ORDER GRANTING MOTION FOR CLARIFICATION AND CLARIFYING PREVIOUS ORDER

(Issued June 13, 1962)

On May 4, 1962, Champlin Oil & Refining Company (Operator), *et al.*, (Champlin) filed a motion for clarification of the Commission's order issued November 22, 1961, in the above-entitled proceeding, providing for hearings on and suspension of proposed changes in rates and making rates effective subject to refund. The motion states that in Docket No. RI62-194 Champlin filed for an "estimated" increased rate of 14.7165¢ per Mcf [1] pursuant to a contractual right to be reimbursed by its buyer, Tennessee Gas Transmission Company (Tennessee), for three-fourths of the full amount of the Dedicated Reserve Gas Tax (Gas Tax) [2] which Champlin is required to pay to the State of Texas on those volumes of gas sold and delivered by Champlin to Tennessee at the San Salvador Field, Hildalgo County, Texas.[3] The notice of change was designated as Supplement 9 to Champlin's FPC Gas Rate Schedule No. 5.

The motion further states that by order issued November 22, 1961, the increased rate was allowed to become effective on December 2, 1961,[4] and since that time Champlin has submitted to Tennessee monthly charges which vary according to the amount of the Gas Tax which Champlin pays to the State of Texas. However, Champlin states that Tennessee has refused to pay any portion of the rate increase contending that the Commission's order of November 22, 1961, is ambiguous in that it is not clear whether the order constitutes authority for Champlin to charge a rate which varies according to the amount of the Gas Tax paid, or whether the order constitutes authority for Champlin to charge only the specific increased rate of 14.7165¢ per Mcf.

Where gas reserves are dedicated under a gas purchase contract, the Texas Dedicated Reserve Gas Tax is payable by the first purchaser of such gas at the rate of 1.0¢ per Mcf less the amount of the Texas Production Tax per Mcf. Because the amount of the Texas Production Tax may vary, the Texas Dedi-

---

[1] This increased rate includes the previously effective rate of 14.6¢ per Mcf, plus an "estimated" increase of .1165¢ per Mcf for tax reimbursement.

[2] H.B. 20, Chapter 24, Article VI, Acts First Call Session, 57th Legislature of Texas, passed August 16, 1961, and made effective September 1, 1961.

[3] The order issued November 22, 1961, incorrectly states that the producing area for the subject gas is Stratton-Agua Dulce Field, Neuces and Jim Wells Counties, Texas (R.R. Dist. 4).

[4] The November 22 order suspended Champlin's rate increase for one day, and made it effective subject to refund on the condition that an acceptable agreement and undertaking was filed with the Commission within 20 days of the issuance of the order.

cated Reserve Gas Tax may also vary. In its notice of change, Champlin made it clear that the proposed increased rate was only estimated and that such rate might vary from time to time depending on the amount of tax actually payable by Champlin to the State of Texas.

Usually a natural gas company may charge and collect only a specified increased rate. However, in the special circumstances of this case, we deem it appropriate to permit Champlin to charge an increased rate that shall vary according to the amount of the Gas Tax paid by Champlin. To that end we shall clarify our suspension order of November 22, 1961.

The Commission finds:

(1) Champlin's motion for clarification should be granted as hereinafter ordered.

(2) The Commission's order of November 22, 1961, should be clarified to authorize Champlin, as of the time that the rate contained in Supplement No. 9 to its FPC Gas Rate Schedule No. 5 became effective subject to refund, to charge Tennessee a rate which varies according to the amount of the Gas Tax that Champlin pays to the State of Texas (i.e., the previously effective rate of 14.6¢ per Mcf, plus a tax reimbursement equal to three-fourths of the full amount of the Gas Tax which is paid by Champlin).

The Commission orders:

(A) The motion for clarification of Champlin Oil & Refining Company (Operator), *et al.*, is hereby granted.

(B) The Commission's order of November 22, 1961 is hereby clarified to authorize Champlin, as of the time that the rate contained in Supplement No. 9 to its FPC Gas Rate Schedule No. 5 became effective subject to refund, to charge Tennessee Gas Transmission Company a rate which varies according to the amount of the Gas Tax that Champlin pays to the State of Texas (i.e., the previously effective rate of 14.6¢ per Mcf, plus a tax reimbursement equal to three-fourths of the full amount of the Gas Tax which is paid by Champlin).

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

UNITED NATURAL GAS COMPANY, DOCKET NOS. G–12493, G–17763; THE SYLVANIA CORPORATION, DOCKET NO. G–12565

ORDER APPROVING RATE SETTLEMENT, PRESCRIBING REFUNDS AND TERMINATING PROCEEDINGS

(Issued June 13, 1962)

These consolidated proceedings arise under Sections 4 and 5 of the Natural Gas Act and involve the proposed increased rates and charges tendered for filing by United Natural Gas Company (United) in Docket Nos. G–12493 and G–17763 and also an investigation of the rates and charges of The Sylvania Corporation (Sylvania), United's affiliate. Both companies are wholly-owned subsidiaries of National Fuel Gas Company.

The proceeding in Docket No. G–12493 involves the revised tariff sheets tendered for filing by United on April 1, 1957, whereby it proposed to increase its rates and charges by $1,267,300 annually. These revised tariff sheets became effective subject to refund as of October 15, 1957.

The proceeding in Docket No. G–17763 involves the revised tariff sheets tendered for filing by United on January 5, 1959, whereby it proposed to further increase its rates and charges by $410,900 annually over and above the increase proposed in Docket No. G–12493. These revised tariff sheets became effective subject to refund as of May 15, 1959.

The proceeding in Docket No. G–12565 involves an investigation of the rates and charges of Sylvania which provides transportation and storage service and also sells natural gas to United, its affiliate.

On April 4, 1962, pursuant to consolidation and hearing notice, hearings were commenced. They were recessed from time to time, however, to permit settlement negotiations sought by the Company. On May 28, 1962, in hearing, counsel for United and Sylvania submitted for the record a stipulation and agreement, dated May 28, 1962, together with certain documents which included United's proposed offer of settlement dated March 19, 1962, and the cost of service studies prepared by the company and distributed to all parties on that date. Commission staff counsel also submitted for the record certain documents containing cost of service studies prepared by the staff and submitted to all parties to these proceedings for their consideration in the settlement negotiations which were held in Commission conference rooms during hearing recesses. The Presiding Examiner certified the record and the stipulation and agreement to the Commission for its consideration and concluded the hearing subject to further order of the Commission.

The record reflects the agreement of Peoples Natural Gas Company, Prospect Oil and Gas Company, Mercer Gas Light and Fuel Company, the Pennsylvania Public Utility Commission, and the two companies affiliated with United and Sylvania, Iroquois Gas Corporation and Pennsylvania Gas Company. The record also reflects the position of the City of Buffalo, New York, which is that while it "does not, as a matter of policy, accept stipulations and agreements in rate cases", it will abide by any order of the Commission issued in connection with this settlement agreement. The record also reflects that the Commission staff has agreed to the proposed settlement and recommends it to the Commission.

Briefly stated, the proposed settlement agreement provides as follows:[1]

(1) United shall file revised tariff sheets, to become effective as of April 1, 1962, reducing the rates subject to refund in Docket No. G–17763 for contract demand service (Rate Schedule CD–1) by 9.0¢ in demand to $2.81 per Mcf per month and by 0.5¢ in commodity to 38.5¢ per Mcf and for general service (Rate Schedule G–1) by 1.0¢ to 57¢ per Mcf. (Appendix B hereto)[2]

(2) United shall refund $999,984 plus interest at 6% per annum to its wholesale jurisdictional customers covering the period October 15, 1957, through December 31, 1961, of which $249,588 is applicable to the period October 15, 1957, through May 14, 1959, (Docket No. G–12493, Appendix C hereto page 1) and $750,396 is applicable to the period May 15, 1959, through December 31, 1961 (Docket No. G–17763, Appendix C, page 2). Further refunds shall be made by United covering the period from January 1, 1962, through March 31, 1962, computed on the difference between the contingent rates charged and the settlement rates (Appendix B hereto and paragraph (1) above). In addition to the said $999,984, United shall refund $300,016 to its wholesale jurisdic-

[1] For convenience only, Appendices A, B, C, and D to the proposed agreement are attached hereto. On both sheets of Appendix C there have been added certain appropriate sub-headings over each column of refund amounts.

[2] The settlement rates for the future are based upon an adjusted jurisdictional cost of service for the calendar year 1961 of $13,048,953, which is $226,098 less than the revenues collected during that year (Appendix B).

tional customers, which represents a flow-through of refunds (including interest) received from Texas Eastern Transmission Corporation and The Manufacturers Light and Heat Company (Appendix C, pages 1 and 2).

(3) If United receives a refund in the future, after March 31, 1962, from the six suppliers listed in Appendix D hereto, relating to the period October 15, 1957, through March 31, 1962, then United shall refund the jurisdictional portion of such amounts received (in the same manner as received, including interest received) except that United shall not be required to make any refunds out of amounts received until the accumulated amounts received total $50,000 or more, except for the final refund which need not be made if the amount refundable is less than $10,000.

(4) If any of the suppliers listed in Appendix D hereto are required to reduce their future rates below the rates used for the purpose of determining the 1961 cost of service (Appendix B hereto) utilized for the future in the settlement, then United shall file a reduction in the settlement rates (paragraph (1) above); provided that no such reduction need be made unless and until such reductions reduce the average weighted cost of purchased gas derived from the 1961 settlement cost of service by at least $50,000 per year; and provided, further, that if United is required to repay to any of its suppliers refunds received by it due to the invalidation by the courts of this Commission's refund orders, United will be permitted to offset such repayments against any refunds in hand or thereafter received from any of its suppliers until reimbursed for such repayment.[3]

(5) There will be a moratorium on the filing of further rate increases by United for a period of 18 months from the date of this order, except to recover increased costs resulting from (a) increased purchased gas costs on a weighted average basis related to the 1961 settlement cost of service (Appendix B), and (b) new taxes or increased tax rates which result in an annual increase of $50,000 or more in costs applicable to jurisdictional sales.

(6) No reductions shall be made in Sylvania's rates and charges.

(7) These consolidated proceedings be terminated upon approval of the agreement by the Commission; subject only to future refund and rate reduction provisions pursuant to Article III of the agreement (paragraph (3) and (4) of above summary).

(8) United shall file certain revised tariff sheets to modify its tariff provisions relating to limitations on deliveries and to substitute certain language relating to cancellation of service agreements. The agreement also contains additional provisions that it is conditioned upon the Commission's approval of its terms and conditions, that no party shall be considered as having agreed to any rate making principle or method, and that the parties request the Commission to waive compliance with its regulations insofar as it is necessary to carry out the provisions of the agreement.

The Commission finds:

(1) The proposed increased rates and charges which became effective on May 15, 1959, subject to hearing and refund in Docket No. G–17763, as hereinabove described, have not been shown to be just and reasonable, or otherwise lawful under the terms and provisions of the Natural Gas Act, and such rates and charges should be disallowed and denied as hereinafter provided and ordered.

[3] United's counsel, in hearing on the record stated that the only instance in which it is intended that the right to offset repayments of refunds, would arise, due to invalidation of refunds by the courts, would be that arising from the Commission's interim order issued August 9, 1960, in Tennessee Gas Transmission Company, Docket No. G–19983 [24 FPC 204].

(2) The settlement of these consolidated proceedings on the basis proposed and agreed to by the parties and certified to us by the Presiding Examiner for our consideration, as above described and as more specifically set forth in said stipulation and agreement, is reasonable and proper in the public interest in carrying out the provisions of the Natural Gas Act and such proposed settlement agreement should be approved and be made effective, subject to the terms and conditions hereinafter provided and ordered.

The Commission orders:

(A) The proposed increased rates and charges contained in the rate filings referred to in paragraph (1) above, are disallowed and denied.

(B) The settlement of these consolidated proceedings on the basis and terms contained in the settlement agreement as hereinabove described, is approved and made effective, subject to the terms and conditions hereinafter ordered.

(C) United shall, within 45 days of the date of this order, make refunds of excess charges currently due to its jurisdictional customers, including interest thereon from the dates of payment of such excess charges until the date of mailing payments of such refunds, as provided in Articles I, II, and III, as described hereinabove in paragraphs (2), (3) and (4) of the above summary of the agreement, and as partly set forth in Appendix C hereto.

(D) United shall make future refunds and necessary rate reductions to reflect refunds and rate reductions of its suppliers, as provided in Article III of said agreement, and as described in paragraphs (3) and (4) of the above summary of the agreement, subject to the approval of the Commission.

(E) Within 20 days after refunds have been made as provided in paragraph (C) hereof, United shall report to the Commission, in writing and under oath, the amount of the refunds (including interest), made to each of its utility customers (in sufficient detail) to enable verification of the manner in which such refunds were computed), and shall serve a copy of such report upon each of its said customers receiving a refund. Concurrently therewith, United shall file with the Commission releases from its jurisdictional customers showing receipt of principal and interest so paid.

(F) Upon payment of the amounts of refunds provided in Article III of the agreement, and upon compliance with the terms and conditions of paragraphs (C) and (E) of this order, the proceedings in Docket Nos. G–12493, G–17763, and G–12565 shall be terminated, subject only to United's obligations under paragraph (D) and (E) hereof and under Article III of the agreement relating to such future refund and rate reduction obligations.

(G) Nothing contained in this order shall be construed as a waiver of the requirements of Section 7 of the Natural Gas Act, as amended; nor shall it be construed as constituting approval by this Commission of any service, rate, charge, classification, or any rule, regulation, contract or practice affecting such service or rate provided for in the above-described tariff sheets; nor shall this order be deemed as recognition of any claimed contractual right or obligation affecting or relating to such service or rate.

(H) This order is without prejudice to any findings or orders which have been or may hereafter be made by the Commission and is without prejudice to any claims or contentions which may be made by the Commission, United, Sylvania, the Commission staff, or any other party affected by this order, in any proceeding now pending or hereafter instituted by or against United or Sylvania or any other persons or parties affected by this order.

APPENDIX A

UNITED NATURAL GAS COMPANY, DOCKET NO. G–17763

Year 1961 summary cost of service (Exclusive of Distribution)

Operating expenses:	
Production:	
Purchased gas	$22, 844, 772
Gas delivered to storage (credit)	(5, 236, 219)
Gas withdrawn from storage	4, 989, 300
Other production expenses	1, 164, 748
Total production	23, 762, 601
Storage	699, 126
Transmission	805, 739
Administrative and general expenses	710, 480
Total operating expenses	25, 977, 946
Depreciation and depletion	914, 938
Taxes other than income	260, 354
Pennsylvania State income taxes	174, 958
Federal income taxes	1, 419, 905
Return 6.5%	1, 973, 671
Subtotal	30, 721, 772
Other gas revenues (credit)	(86, 922)
Total cost of service	30, 634, 850

APPENDIX B

UNITED NATURAL GAS COMPANY, DOCKET NO. G–17763

Allocation of cost of service for calendar year 1961 and determination of prospective rates

		Total	Demand	Commodity
1	Total cost of service	$30, 634, 850	$7, 891, 525	$22, 743, 325
2	Allocation factor—percent		36. 743311	44. 559645
3	Jurisdictional cost of service	$13, 033, 953	$2, 899, 608	$10, 134, 345
4	Regulatory commission expense	15, 000	7, 500	7, 500
5	Adjusted jurisdictional cost of service	13, 048, 953	2, 907, 108	10, 141, 845
6	Jurisdictional revenue collected	13, 275, 051		
7	Excess revenue (Line 6 minus line 5)	226, 098		
8	Billing determinants (Mcf)		[1] 1, 049, 845	26, 234, 979
9	Unit costs (Per Mcf)		$2. 769	38. 6577¢
10	Prospective rates (Per Mcf):			
	Rate Schedule CD–1		$2. 81	38. 5¢
	Rate Schedule G–1 [2]			57. 0¢

[1] Billing demand units for G–1 customers imputed at 50% load factor.
[2] Equivalent to 50% load factor charge under Rate Schedule CD–1.

CHUGACH ELECTRIC ASSOCIATION, INC., PROJECT NO. 2170

ORDER FURTHER AMENDING LICENSE (MAJOR)

(Issued June 14, 1962)

Application was filed January 9, 1961 by Chugach Electric Association, Inc., licensee for major Project No. 2170, to be located on Cooper Lake, Cooper Creek and Kenai Lake, Alaska, for further amendment of its license for the proposed project so as to authorize a change in a portion of the route of the Cooper Lake —Anchorage 115 kv transmission line from the presently authorized route shown on Exhibit J (FPC No. 2170-14) now approved as part of license issued May 27, 1957, 17 FPC 759.

The project affects lands of the United States within the Chugach National Forest.

The license presently authorizes a transmission line route originating at the Cooper Lake Hydroelectric plant of Chugach, and extending northward to Snipers Point on the south shore of Turnagain Arm (an arm of Cook Inlet), and thence by an aerial cable 2.5 to 3.0 miles in length to Bird Point on the north shore, and, finally, northwesterly to Anchorage.

The application for amendment requests authorization to eliminate the aerial cable across Turnagain Arm and in lieu thereof reroute the line around the head of Turnagain Arm. The licensee advises that the proposed route is more feasible and will result in a savings of approximately $700,000 in construction costs.

The Secretary of Agriculture, in reporting on the application, has advised that, provided certain recommended special conditions are included in the license as further amended, his Department finds that the transmission line located along the route as proposed in the subject application for amendment will not interfere or be inconsistent with the purpose for which the Chugach National Forest was created or acquired. We are hereinafter including in the license the recommended special conditions.

The Commission finds:

The license, further amended as hereinafter provided, will not interfere or be inconsistent with the purposes for which the Chugach National Forest was created or acquired, and will not alter any of the basic facts upon which the license was issued.

The Commission orders:

(A) The license for proposed Project No. 2170 is hereby further amended, effective as of June 1, 1962, as follows:

PARAGRAPH I. Finding (2) (b) of the license is amended by inserting after the word "Anchorage" in the 8th line of page 3 of the license the words "via Hope Junction, Johnson's Pass and Bird Point."

PARAGRAPH II. The following new articles are added to the license:

Article 32. The Licensee shall construct the transmission line on the location which has been prescribed and referenced on the ground by the U. S. Forest Service. Any deviation from this route must have the approval of the Forest Supervisor prior to the start of construction.

Article 33. The Licensee shall not clear any portion of the right-of-way until the width of clearing has been prescribed and mutually agreed upon by the U. S. Forest Service and the Licensee.

Article 34. It is recognized that others may construct electric generating facilities which may require transmission facilities to be constructed along a portion or portions of the route of the transmission facilities constructed by the Licensee pursuant to this license. To prevent unnecessary duplication of transmission facilities, the Licensee shall, when ordered to do so by the Commission, and based upon recommendations of the U. S. Forest Service: (1) wheel electric power and energy of such others over its transmission facilities to the extent and as long as the Licensee shall have surplus capacity available in its transmission facilities for such purpose, or (2) enter into an agreement with such others for the joint use of its transmission poles upon terms, conditions, and charges to be established by the Commission, subject to adequate provisions for (1) payments by such others for necessary construction to carry out the wheeling or joint-use agreement, and (2) protection of the Licensee's service area and noninterference by such others in the Licensee's operations.

Article 35. The Licensee shall perform such erosion control and other measures as are necessary to restore to a condition satisfactory to the U. S. Forest Service the cleared lands on the route originally authorized by this license between Frenchy Creek and Snipers Point. Such measures shall be prescribed by the U. S. Forest Service and performed by the Licensee at the earliest practicable date and not later than September 1, 1962.

PARAGRAPH III. This amendment in the manner set out above shall not operate to alter or amend the license in any other respect, and shall not in any way constitute a waiver of any other part, provision or condition of the license.

(B) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313 (a) of the Act, and failure to file such an application shall constitute acceptance of this license amendment. In acknowledgment of the acceptance of this license amendment, it shall be signed for the licensee and returned to the Commission within 60 days from the date of issuance of this order.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

CIMARRON TRANSMISSION COMPANY, DOCKET NO. CP62-234

FINDINGS AND ORDER ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued June 14, 1962)

On April 2, 1962, Cimarron Transmission Company (Applicant) filed in Docket No. CP62-234 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction during the calendar year 1962 of field facilities and the operation thereof to enable Applicant to take into its certificated main pipeline system natural gas which may be purchased from producers thereof, all as more fully set forth in the application.

The purpose of this "budget-type" application is to augment Applicant's ability to act with reasonable dispatch in contracting for and connecting to its pipeline system new supplies of natural gas in various producing areas generally coextensive with said system.

The total cost of the proposed facilities will not exceed $75,000, and no single project will exceed a cost of $15,000. The subject facilities will be financed from cash on hand, from cash generated from normal operations and internal sources, and from financing already arranged.

Pursuant to due notice, a public hearing was held in Washington, D. C., on June 5, 1962, respecting the matters involved in and the issues presented by the application herein. No protest to the granting of the application or petition to intervene has been received. Staff counsel moved orally at the hearing that the intermediate decision procedure be omitted and that the Commission render a decision herein pursuant to Section 1.30(c)(1) of its Rules of Practice and Procedure.

The Commission finds:

(1) Applicant, Cimarron Transmission Company, an Oklahoma corporation having its principal place of business in Tulsa, Oklahoma, is a "natural-gas company" within the meaning of the Natural Gas Act as heretofore found by the Commission in its order of December 17, 1959, in Docket No. G–17014, *et al.* (22 FPC 1059).

(2) The facilities hereinbefore described, as more fully described in the application in this proceeding, are proposed to be used in the transportation of natural gas in interstate commerce, subject to the jurisdiction of the Commission, and the construction and operation thereof by Applicant are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules, and regulations of the Commission thereunder.

(4) The construction and operation of facilities to take natural gas purchased from producers thereof as proposed by Applicant are required by the public convenience and necessity, and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a) and (e) of Section 157.20 of such Regulations.

(6) It is necessary and appropriate in carrying out the provisions of the Natural Gas Act that Applicant should submit, on or before March 1, 1963, a statement under oath showing by projects: (a) names of fields connected, (b) estimates of gas supplies attached, (c) a description of the project or projects that have been constructed pursuant to the authorization hereinafter granted, (d) the location of said project or projects, (e) the actual final costs of said facilities, and (f) the names of the independent producers involved, together with the respective dates of the gas sales contracts and the docket numbers of the related producer certificate applications.

(7) The authorization hereinafter granted should be limited to construction during the calendar year 1962, and the total expenditures for facilities to be constructed thereunder should be limited to a maximum of $75,000, with no single project to exceed a cost of $15,000.

(8) A request during the public hearing by staff counsel for omission of the intermediate decision procedure herein was unopposed by any party of record and, not having been denied by the Commission, is granted pursuant to Section 1.30(c) (1) of the Commission's Rules of Practice and Procedure.

The Commission orders:

(A) Upon the terms and conditions of this order, a certificate of public convenience and necessity be and the same is hereby issued authorizing Cimarron Transmission Company to construct during the calendar year 1962 the proposed facilities hereinbefore described, as more fully described in the application in this proceeding, and to operate the facilities only to take natural gas supplies from producers who have received authorization from the Commission to sell natural gas to Cimarron Transmission Company.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a) and (e) of Section 157.20 of such Regulations.

(C) Applicant shall submit on or before March 1, 1963, a statement under oath showing by projects: (a) names of fields connected, (b) estimates of gas supplies attached, (c) a description of the project or projects constructed pursuant to the authorization hereinbefore granted, (d) the location of said project or projects, (e) the actual final costs of said facilities, and (f) the names of the independent producers involved, together with the respective dates of the gas sales contracts and the docket numbers of the related producer certificate applications.

(D) The authorization granted in paragraph (A) above is hereby limited to construction during the calendar year 1962, and the total expenditures for facilities to be constructed thereunder are hereby limited to a maximum of $75,000, with no single project to exceed a cost of $15,000.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

COASTAL TRANSMISSION CORPORATION, *ET AL.* DOCKET NO. G–18338, *ET AL.*

ORDER FURTHER AMENDING ORDER ISSUING CERTIFICATES OF PUBLIC CONVENIENCE AND NECESSITY

(Issued June 14, 1962)

On February 19, 1962, as supplemented on March 30, 1962, Coastal Transmission Corporation (Coastal) and Florida Gas Transmission Company (Florida Gas) (formerly Houston Texas Gas and Oil Corporation) filed a joint motion to amend the Commission's order issued August 9, 1961, in Docket Nos. G–18338, *et al.*, 26 FPC 318, as further modified by order issued November 2, 1961, 26 FPC 677, in respect to the certificates of public convenience and necessity granted to Coastal and Florida Gas in Docket Nos. G–18338 and G–18615, respectively, all as more fully set forth in the aforesaid motion and supplement.

The requested amendments to the subject certificate authorizations are as follows:

(1) Florida Gas, in Docket No. G–18615, to construct and operate approximately 9.3 miles of 4½-inch lateral pipeline from a point on its 20-inch main transmission line in Indian River County, Florida, to the site of a new electric generating plant in the City of Vero Beach, Florida, in lieu of the presently authorized approximately 6 miles of 2⅞-inch lateral pipeline to the site of the old City of Vero Beach electric generating plant. This proposed change is esti-

mated to increase the cost of the Vero Beach lateral from $115,700 to $196,300, or an additional $80,600.

(2) To delete from Coastal's authorization in Docket No. G–18338 the following facilities which Coastal does not propose to construct and operate: (a) Fulton Beach Tap, (b) Potrero Lopena 14.2-mile lateral pipeline, and (c) Palacios Lateral 1.2-mile extension lateral to facilities of Socony, Mobil Oil Company. The estimated total cost of these facilities was $458,695.

(3) Coastal, in Docket No. G–18338, to construct and operate a 1.3-mile addition to the Palacios Lateral system extending from the new terminus of the Palacios Lateral to the Tenneco (Tennessee Gas Transmission Company) processing plant in Matagorda County, Texas, at an estimated cost of $39,000.

(4) Coastal, in Docket No. G–18338, to construct and operate approximately 6.1 miles of 8-inch loop pipeline from the end of the presently authorized 6.0 miles of 8-inch loop on the Palacios Lateral to the aforesaid new terminus thereof, at an estimated total cost of $174,400.

(5) Coastal, in Docket No. G–18338, to increase the size of the presently authorized approximately 16 miles of 8-inch pipeline comprising the so-called Lake Chicot Lateral in St. Martin and Iberia Parishes, Louisiana, to approximately 11.1 miles of 10-inch pipeline and 4.9 miles of 12-inch pipeline. This proposed change is requested to provide sufficient capacity in the subject lateral to permit further development of the field which it serves. Said change is estimated to increase the cost of the Lake Chicot Lateral from $836,489 to $960,000, or an additional $123,511.

(6) Florida Gas, in Docket No. G–18615, (by the Supplement filed on March 30, 1962, to the February 19, 1962, motion to amend) to increase the size of the presently authorized approximately 32 miles of 6⅝-inch pipeline comprising the so-called Indian River Lateral extending from Florida Gas' 20-inch main transmission line to the Indian River electric generating plant of the Orlando Utilities Commission near Delespine, Brevard County, Florida, to a diameter of 8⅝-inches. This proposed change is requested to provide sufficient capacity in the subject lateral to take care of indicated future requirements which exceed those expected at the time of the original application. Said change is estimated to increase the cost of the Indian River Lateral from the original figure of $744,016 to $856,000, or an additional $111,984.

Notice of the filing of the aforesaid joint motion to amend was published in the Federal Register on May 25, 1962 (27 FR 4944). No protest, petition to intervene or request for hearing has been received.

On March 14, 1962, Florida Gas filed a motion to amend the Commission's order issued November 2, 1961, in Docket Nos. G–18338, *et al.*, to reflect the change in franchise of particular customers proposed to be served under the existing authorization, as follows: (1) from the City of Boca Raton, Florida, to the Florida Public Utilities Company, and (2) from the Pompano Natural Gas Company to the City Gas Company of Florida. Construction of the authorized facilities for these two services had not begun as of March 14, 1962, but no change in the construction authorization is proposed. On March 29, 1962, Florida Gas filed a notice of withdrawal of that portion of the March 14 motion for amendment relating to Pompano Natural Gas Company due to a local controversy in which Florida Gas is not involved.

The Commission finds:

It is necessary and appropriate in carrying out the provisions of the Natural Gas Act and the public convenience and necessity require that the order of the Commission issued August 9, 1961, in Docket Nos. G–18338, *et al.*, as modified by order issued November 2, 1961, be further amended as hereinafter ordered.

The Commission orders:

(A) The order of the Commission issued August 9, 1961, in Docket Nos. G–18338, *et al.*, as modified, be and the same is hereby further amended to reflect and authorize the changes set forth as Items (1) to (6), inclusive, hereinabove.

(B) Said order be and the same is hereby further amended by substituting Florida Public Utilities Company for the City of Boca Raton, Florida, as the purchasing distributor of natural gas for the Boca Raton area.

(C) In all other respects, said order of August 9, 1961, in Docket Nos. G–18338, *et al.*, as previously modified, shall remain in full force and effect.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

SIERRA PACIFIC POWER COMPANY, DOCKET NO. E–7031

ORDER AUTHORIZING THE ISSUANCE OF FIRST MORTGAGE BONDS

(Issued June 14, 1962)

Sierra Pacific Power Company (Applicant), a corporation organized under the laws of the State of Maine and doing business in the States of California and Nevada, with its principal place of business at Reno, Navada, filed an application on March 29, 1962, as amended on April 17 and 21 and on May 11 and 28, 1962, for an order or orders, pursuant to Section 204 of the Federal Power Act, authorizing the issuances of: (1) Short-term Promissory Notes in the aggregate principal amount of not in exceess of $5,000,000 outstanding at any one time, and (2) $5,000,000, principal amount of First Mortgage Bonds, due 1992. By order issued May 16, 1962, 27 FPC 965, in the above-named docket, the Commission authorized the issuance of the afore-mentioned Promissory Notes. By amendment filed May 11, 1962, Applicant now requests that an order be issued authorizing the proposed issuance and sale at competitive bidding of the afore-mentioned First Mortgage Bonds.

Applicant proposes to issue the Bonds under its Indenture of Mortgage, dated December 1, 1940, as heretofore supplemented and as to be further supplemented by an Eighth Supplemental Indenture dated as of June 1, 1962, between Applicant and New England Merchants Bank of Boston and Fletcher C. Chamberlin, Trustees.

Applicant proposes, on or about June 19, 1962, to publicly invite sealed, written bids for the purchase of the proposed Bonds, by newspaper publication and by distribution of a Form of Proposal, together with a Statement of Terms and Conditions relating thereto and a Form of Purchase contract. All bids, whether from a single bidder or a group of bidders, must be for the purchase of the entire issuance of Bonds and must be on the Form of Proposal provided by Applicant. Each bid must specify, among other things: the interest rate to be borne by the Bonds, which rate shall be a multiple of ⅛th of 1 percent; the price exclusive of accrued interest to be paid to Applicant for the Bonds, which price shall be not less than 100% and not more than 102¾% of the principal amount thereof; in the case of a bid by a group of bidders, the principal amount of the Bonds to be purchased by each member of the group; and, that Applicant shall be paid the amount of the accrued interest on the Bonds from June 1, 1962 to the date of payment therefor and delivery thereof.

Unless postponed all bid for the purchase of the proposed Bonds must be presented in duplicate to Applicant at 49 Federal Street (8th Floor), Boston,

Massachusetts, before 11:00 a.m., Boston Time, on June 26, 1962. Applicant, unless it rejects all bids or excludes a bid or bids for reasons specified in the Statement of Terms and Conditions, will accept the bid which provides for the lowest annual cost of money. Each bid must be accompanied by a certified, bank cashier's, or trust company treasurer's check or checks in the aggregate amount of $150,000, payable in Boston or New York Clearing House funds.

Applicant will use the net proceeds from the sale of the proposed Bonds for the payment of short-term bank loans then outstanding and to finance in part Applicant's 1962 construction program. By order issued May 16, 1962 in this docket Applicant was authorized to issue Short-term Promissory Notes aggregating in principal amount not in excess of $5,000,000 outstanding at any one time and maturing not later than September 30, 1962. Applicant expects that it will have short-term Notes in the aggregate principal amount of approximately $3,400,000 outstanding at the time of the sale of the proposed new Bonds. Principal items of expenditure for Applicant's 1962 construction program, estimated to cost $11,659,900, are, as follows: $2,898,000 for continuing installation of Unit No. 1 and $1,014,000 for gas turbines, at Applicant's Frank A. Tracy Station, 17 miles east of Reno; $1,170,100 for transmission lines and substations, including $340,000 for the Buckeye-Tahoe Valley 120 kv line (total cost estimated at $540,000, to be completed in 1963) and $344,600 for the 120 kv Brunswick-Minden line; $3,048,900 for improvements to power plants, transmission and distribution system, for distribution and transmission substations, and for extensions, meters, services and transformers needed to serve new customers; $2,016,000 for extensions and improvements to existing facilities, reservoirs and flumes of Applicant's water department; $386,100 for Applicant's gas department; and $1,064,400 for general plant.

Written notice of the application has been given to the California Public Utilities Commission and the Nevada Public Service Commission, and to the Governor of each of those States. Notice of the application was also given by publication in the Federal Register on April 7, 1962 (27 F.R. 3362), stating that any person desiring to be heard or to make any protest with reference to the application should file a petition or protest on or before the 24th day of April, 1962 with the Federal Power Commission, Washington 25, D. C. No protest or petition or request to be heard in opposition to the granting of the application has been received.

The Commission finds:

(1) Applicant, a corporation, is a public utility within the meaning of Section 204 of the Federal Power Act, subject to the jurisdiction of the Commission as heretofore described and set forth in the Commission's order issued May 2, 1961, *Sierra Pacific Power Company*, Docket No. E-6984 (25 FPC 904).

(2) The proposed issuance and sale of Bonds, as described above, will constitute an issuance of securities within the purview of Section 204 of the Act.

(3) Applicant is not organized and operating in a State under the laws of which the security issue here involved is regulated by a State commission within the meaning of Section 204(f) of the Act; and the proposed issuance of securities is, therefore, not exempt by virtue of that Section from the requirements of Section 204 of the Act.

(4) The proposed issuance and sale of Bonds, as hereinafter authorized, will be for a lawful object, within the corporate purposes of Applicant and compatible with the public interest, which is appropriate for and consistent

with the proper performance by Applicant of service as a public utility and which will not impair its ability to perform that service, and is reasonably necessary and appropriate for such purposes.

The Commission orders:

(A) The proposed issuance and sale of Bonds, upon the terms and conditions and for the purposes specified in the application, as described above, are authorized, subject to the provisions of this order.

(B) The proposed issuance and sale of Bonds at competitive bidding shall not be consummated until:

(i) Applicant shall have amended its application pursuant to the requirements of Section 34.2(k)(3) of the Commission's Regulations under the Federal Power Act relating to compliance with competitive bidding requirements, and Section 34.2(k)(4) of those Regulations relating to affiliation, and shall have either filed such amendments or shall have mailed them and advised the Commission by telephone and telegraph, as contemplated in Section 34.9 of the Regulations.

(ii) The Commission, by further order, shall have approved the price to be received by Applicant for the proposed issuance of Bonds and the interest rate thereof.

(C) This authorization shall expire unless the transaction hereby authorized is consummated within 60 days from the date of issuance of this order.

(D) The foregoing authorization is without prejudice to the authority of this Commission or any other regulatory body with respect to rates, service, accounts, valuation, estimates or determinations of cost, or any other matter whatsoever now pending or which may come before this Commission.

(E) Nothing in this order shall be construed to imply any guarantee or obligation on the part of the United States with respect to any securities to which this order relates.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

ALABAMA POWER COMPANY, PROJECT NO. 2146

ORDER FURTHER AMENDING LICENSE (MAJOR)

(Issued June 15, 1962)

Application was filed on September 16, 1960, and supplemented on November 30, 1960, by Alabama Power Company, licensee for major Project No. 2146, for further amendment of its license for the project situated on the Coosa River, navigable waters of the United States and affecting lands of the United States.

The application as supplemented proposes revision of Article 41 of the license to authorize the raising of the normal operating water surface of Logan Martin Reservoir from elevation 460 to 465 feet and to make minor changes in the name-plate ratings of the two authorized turbines and generators to be installed in the powerhouse.

On June 16, 1961, the licensee filed application for further amendment of the license for authorization to install the third generating unit in the Logan Martin Development during initial construction.

The Logan Martin Development was formerly known as the Kelly Creek Development.

Recent load forecast and power supply studies, obtained by taking detail load forecasts for 1962, 1963 and 1964 from each of the four operating com-

panies forming the Southern integrated system and developing therefrom a diversified system total, indicate that the power output from the Logan Martin development, constructed initially to its ultimate capacity of 128,250 kilowatts (3-units of 42,750 kilowatts each), will be required to meet the estimated 1964 system load and its dependable capacity thereon is estimated at 125,300 kw. The average annual energy to be obtained from the ultimate installation is estimated at 392.8 million kwh. The capital cost of the ultimate development, constructed initially, is estimated at $34,759,000. Based on power values of $26.73 per kw-year for dependable capacity and 2.30 mills per kwh for average annual energy, the estimated annual value of the power output is about $4,255,000. The annual cost of the ultimate development, constructed initially, is estimated at $4,082,000—hence the annual net benefits therefrom amount to about $173,000.

The effect of granting the applications will be reflected in the description of the project works of the Logan Martin Development, in the amount of administrative annual charges payable under the license, and in Article 41 pertaining to the operating level of the Logan Martin Reservoir.

The Chief of Engineers and the Secretary of the Army have reported that the raising of the Logan Martin reservoir is satisfactory insofar as the interests of navigation and flood control are concerned and additional terms and conditions in the interest of navigation or flood control are not considered necessary for inclusion in any amendment issued. Revised plans of the structures affecting navigation or flood control have been approved in accordance with Section 4(e) of the Federal Power Act.

An Assistant Secretary of the Interior has reported that the raising of the Logan Martin reservoir would not have any adverse effect on the fish and wildlife resources of the area involved.

The Commission finds:

(1) The license, further amended as hereinafter provided, will not interfere or be inconsistent with any reservation or withdrawal of lands of the United States and is in the public interest.

(2) Public notice of the September 16, 1960 application has been given. No protests have been received.

(3) The authorized installed horsepower capacity of the project for the purpose of computing the capacity component of the administrative annual charge is 724,000 horsepower, and the increased annual charge for reimbursing the United States for the costs of administration of Part I of the Federal Power Act, based on such capacity, as hereinafter provided, is reasonable.

(4) The following described revised exhibits conform to the Commission's rules and regulations and should be approved as part of the license and the exhibits described herein as being superseded should be eliminated from the license for the project:

Exhibit L	FPC No.	Logan Martin Development
Revision No. 2. Sheet No. 10.	2146-162	Plan, Dike & Spillway Section.
Revision No. 3. Sheet No. 10A.	2146-168	Powerhouse Transverse Section.
Revision No. 1. Sheet No. 10A-1.	2146-169	Powerhouse—Transverse Section.
Revision No. 3. Sheet No. 10B.	2146-170	Powerhouse Longitudinal Section.
Revision No. 3. Sheet No. 10C.	2146-171	Powerhouse Floor Plans.
Revision No. 3. Sheet No. 10D.	2146-172	Powerhouse Floor Plans.

superseding Exhibit L-Revised, sheets Nos. 10, 10A, 10B and 10C (FPC Nos. 2146–136 through –139);

> Exhibit M (Revision No. 2) entitled "General description of mechanical, electrical and transmission equipment;"

superseding Exhibit M, now part of the license, insofar as it relates to the Logan Martin (Kelly Creek) development; and

> Exhibit H, Fig. 2-A, a rule curve showing the seasonal variation of the power pool elevation of the Logan Martin reservoir between elevations 460 feet and 465 feet;

superseding Exhibit H, Fig. 2, now part of the amended license.

The Commission orders:

(A) The exhibits described in finding (4) above as conforming to the Commission's rules and regulations are approved as part of the license for the project and the exhibits described in the same finding as being superseded are eliminated from the license for the project.

(B) Th license for Project No. 2146 is further amended, effective as of June 1, 1962, as follows:

PARAGRAPH I: Finding (2) (b) (iii) is amended to read as follows:

> (iii) *The Proposed Logan Martin (Kelly Creek) Development*
> A dam comprised of a concrete gated spillway and powerhouse section and compacted earth abutment dikes; a reservoir, with full power pool elevation 465 feet and an area of about 15,300 acres extending 49.1 miles upstream to Lock 3 dam, having a 5-foot drawdown providing usable power storage of about 74,000 acre-feet and controlled surcharge storage between elevations 460 and 474.6 feet for control of floods; a powerhouse with three 57,000-horsepower turbines connected to three 42,750-kilowatt generators; a substation; and appurtenant electrical and mechanical facilities;

PARAGRAPH II. Article 28 of the license is further revised to show the authorized installed capacity as being increased to 724,000 horsepower.

PARAGRAPH III. Article 41 of the license is amended to read as follows:

Article 41. The Licensee shall make available on a seasonal basis as shown on the rule curve designated as Exhibit H, Fig. 2A, in the application for amendment of license filed September 16, 1960 (which exhibit is incorporated as a part of this license), the storage between elevations 460 and 465 feet in the Logan Martin Reservoir (formerly designated as Kelly Creek Reservoir) for flood control use. For regulating floods comparable to those of record (1929 to 1950), storage will be utilized for induced surcharge operations up to elevation 474.6 feet, and to higher elevations as required to compensate for lost valley storage during greater floods, with the details of operation specified by rules and regulations prescribed by the Secretary of the Army from time to time.

(C) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313 (a) of the Federal Power Act, and failure to file such an application shall constitute acceptance of this amendment of license. In the acknowledgment of the acceptance of this amendment of license, it shall be signed for the licensee and returned to the Commission within 60 days from the date of issuance of this order.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

ARKANSAS-LOUISIANA GAS COMPANY, DOCKET NO. G–17567; ILLINOIS POWER COMPANY, DOCKET NO. G–17984; ST. CHARLES GAS CORPORATION, G–18405; LACLEDE GAS COMPANY, COMPLAINANT v. MISSISSIPPI RIVER FUEL CORPORATION, DEFENDANT, DOCKET NO. G–17832

ORDER MODIFYING OPINION AND ORDER, DENYING REHEARING, AND DENYING MOTIONS

(Issued June 15, 1962)

The Granite City Group of Interveners,[1] Owens Illinois Glass Company, Laclede Gas Company, Mississouri Natural Gas Company, and Arkansas-Louisiana Gas Company, as successor to MidSouth Gas Company (Ark-La, MidSouth), have filed applications for rehearing of the Commission's Opinion and Order No. 355, issued April 18, 1962, 27 FPC 697. Both Owens Illinois and the Granite City Interveners have requested stay of our order. Missouri Natural and Laclede have responded to the Granite City motion for a stay. Mississippi River Fuel Corporation has filed a motion to file an answer to the applications for rehearing and motions to stay, and on May 17, 1962, has filed certain tariff sheets in purported compliance with our order.

In our opinion and order we found that Mississippi had capacity to deliver natural gas in excess of that available to its firm utility customers. We found that this excess capacity was being used in part to serve the company's direct industrial customers under contracts which we found provided for interruptible service. Because of the needs of the utility customers we allocated an additional portion of Mississippi's capacity to them leaving with the industrial customers 25,000 Mcf per day of Mississippi's firm capacity.

The Granite City Interveners and Owens Illinois contend that we have improperly impaired Mississippi's service to them. We are of the opinion that their principal arguments are answered by the considerations expressed in our Opinion No. 355. However, we note that Owens Illinois contends that in reducing the amount of firm gas available for Mississippi's industrial customers we held that the controlling question is not the service actually rendered, but the type of service which Mississippi is contractually obligated to render. We recognize that the question under Section 7(a) of the Gas Act is one of "service", but what we endeavored to explain was that the concept of "service" in this connection includes the obligation and whether such service is "firm" or "interruptible" necessarily depends on the contract terms. *Sunray Mid-Continent Oil Co.* v. *F.P.C.*, 264 U.S. 137, cited by Owens Illinois involved a different question, *i.e.*, whether "service" under section 7(e) which an applicant for a certificate was willing to perform was limited by a contractural term of 20 years.

Owens Illinois contends further that the end result of the order accompanying Opinion No. 355 insofar as it increases the stated or contract demands of Mississippi's utility customers simply means that the utility customers receive additional gas which may be diverted to any use, that is, residential, commercial or even additional industrial sales, and that there will be an impairment of service to the industrial customers of the utilities in the St. Louis area. In our opinion and order we allocated available supplies first to the domestic and

[1] Granite City Steel Company, American Steel Foundries, Inc., American Zinc Company of Illinois, The Dow Metal Products Company, Laclede Steel Company, Olin Mathieson Chemical Corporation, National Lead Company, Pittsburgh Plate Glass Company, C. K. Williams & Company.

commercial customers of the utility customers of Mississippi. The remaining firm gas we allocated to the industrial customers of Mississippi and of the utilities on the basis of their requirements. As it happened the industrial customers of Mississippi, requiring 61,202 Mcf per day, received an allocation of 24,608 Mcf per day[2] while the utility customers requiring 64,017 Mcf per day for industrial service received 25,740 Mcf for this purpose, 40.2 percent of requirements in each case. The record shows the industrial and non-industrial requirements of Mississippi and its customers, and we have allocated the gas on that basis.

In connection with the availability of gas to Mississippi, we may note, as did Owens Illinois, that Mississippi and its subsidiary, Mississippi River Transmission Corporation, have filed an application on May 15, 1962, in Docket No. CP61-341 by which Transmission proposes to sell 35,630 Mcf of gas per day to be purchased from Natural Gas Pipeline Company of America. It appears from the application that a large part of this gas will be available for delivery to Mississippi's industrial customers. While we do not intend to prejudge this proceeding, it supports our statement in the opinion concerning the possibility of additional gas from Transmission.

Missouri Natural Gas Company, Laclede Gas Company, and Ark-La (Mid-South) contend that the increases in demands for gas applicable to them should not become effective prior to December 1, 1962. These three customers of Mississippi argue that they are not able to use the gas before that date but nevertheless will be required to pay a demand charge. The question here is how to treat the summer months of 1962 with respect to the new service to the utility customers. Of course, in 1963 and succeeding years the utility customers will be required to pay a demand charge for the new gas even in those months when they are unable to take their full allocation. In the first year, however, it would not seem equitable to place the entire burden of this additional capacity made available by our opinion on the utility customers before the height of the heating season. On the other hand Mississippi is required to hold this additional capacity available and cannot dispose of it on a firm basis but can dispose of it on an interruptible basis to industrial customers. We think that an equitable solution would be to require that the increased demands of the utility customers be made effective October 1, 1962. Beginning with that month the space heating load of the utility customers would become a significant factor although the peak would not be reached until later in the season.

In the motion filed May 16, 1962, the Granite City Interveners requested stay of our order until further authorization or until the order has been approved by an appropriate court. The request for a stay made by Owens Illinois in its application for rehearing was similar. Missouri Natural and Laclede have opposed the Granite City motion citing the need of their customers for the gas, which the Commission's order allocated to them. The stay requested would result in irreparable injury to Mississippi's utility customers who are the victims of the existing unlawful allocation. The stay is therefore denied.

Mississippi's combined motion for authority to file an answer to the applications for rehearing and motions for stay is not proper and must be denied, for there is no provision in our rules for such a filing.

The Commission further finds:

(1) The assignments of error and grounds for rehearing set forth in the applications for rehearing of the Granite City Interveners and Owens Illinois

[2] Rounded off to 25,000 Mcf per day for the purposes of the Tariff.

present no facts or principles of law which were not considered by the Commission when it issued its Opinion No. 355, or which having now been considered warrant any change or modification of the said opinion except as specified below.

(2) The requests for stay filed by the Granite City Interveners and Owens Illinios should be denied.

(3) The motion of Mississippi to file an answer to applications for rehearing and requests for stay should be denied.

(4) The requests of Missouri Natural, Laclede and Ark-La (MidSouth) for an effective date of December 1, 1962 with respect to increases in demands should be denied, but the date should be October 1, 1962.

The Commission orders:

(A) The applications for rehearing filed in the above-entitled proceedings by the Granite City Interveners and Owens Illinois are hereby denied except as specified below.

(B) Paragraph (E) of our order of April 18, 1962 is hereby amended to read as follows: "Mississippi shall file new or superseding service agreements to be effective October 1, 1962 containing the contract demands stated in paragraph (B) above."

(C) In serving its direct industrial customers Mississippi shall give priority to requirements for pilot lights, space heating and the prevention of physical damage and its service shall be non-discriminatory with respect to the customers served.

(D) The definition of Firm Industrial Service appended to Section 7.2 of the tariff changes required to be filed by paragraph (C) of our order shall be amended as specified in the text of this order.

(E) The requests for stay filed by the Granite City Interveners and Owens Illinois are hereby denied.

(F) The motion of Mississippi to file an answer to applications for rehearing and requests for stay is hereby denied.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

CITIES SERVICE GAS COMPANY, DOCKET NO. CP62-211

FINDINGS AND ORDER ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued June 15, 1962)

On March 12, 1962, Cities Service Gas Company (Applicant) filed in Docket No. CP62-211 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the sale of natural gas and the construction and operation of facilities therefor, in Rice County, Kansas, all as more fully set forth in the application.

Applicant proposes to sell and deliver natural gas to The Gas Service Company (Gas Service) for resale in and about the City of Raymond, Kansas. Gas Service proposes to construct and operate a natural gas distribution system in the City of Raymond for which it has received a Certificate of Convenience and Authority from the Kansas State Corporation Commission and a franchise

from the City of Raymond. Gas Service estimates the natural gas requirements for the proposed distribution system to be as follows:

Year	Mcf at 14.73 psia	
	Peak day	Annual
1	76	7,200
2	95	9,000
3	114	10,800

Applicant proposes to construct and operates a meter and appurtenant regulator facilities to make the subject sale at an estimated cost of $1,610, which will be financed from treasury cash. The sale will be made under Applicant's FPC Gas Tariff on file with the Commission.

Pursuant to due notice, a public hearing was held in Washington, D. C., on June 7, 1962, respecting the matters involved in and the issues presented by the application herein. No protest or petition to intervene has been received. Staff counsel moved orally at the hearing that the intermediate decision procedure be omitted and that the Commission render a decision herein pursuant to Section 1.30 (c) (1) of its Rules of Practice and Procedure.

The Commission finds:

(1) Applicant, Cities Service Gas Company, a Delaware corporation having its principal place of business in Oklahoma City, Oklahoma, is a "natural-gas company" within the meaning of the Natural Gas Act as heretofore found by the Commission in its order of December 28, 1943, in Docket No. G–298 (4 FPC 471).

(2) The facilities hereinbefore described, as more fully described in the application in this proceeding, are to be used in the transportation and sale of natural gas in interstate commerce subject to the jurisdiction of the Commission, and the construction and operation thereof and the transportation and sale of natural gas by Applicant are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules, and regulations of the Commission thereunder.

(4) The construction and operation of the proposed facilities and the proposed sale of natural gas by Applicant are required by the public convenience and necessity, and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c) (3), (c) (4), and (e) of Section 157.20 of such Regulations, and that the construction of the facilities authorized by this order should be completed and said facilities placed in actual operation and the proposed sale hereinafter authorized should commence within 1 year from the date on which this order issues.

(6) A request during the public hearing by staff counsel for omission of the intermediate decision procedure herein was unopposed by any party of record and, not having been denied by the Commission, is granted pursuant to Section 1.30 (c) (1) of the Commission's Rules of Practice and Procedure.

The Commission orders:

(A) A certificate of public convenience and necessity be and the same is hereby issued authorizing Applicant, Cites Service Gas Company, to construct and operate the proposed facilities and to sell and deliver natural gas as hereinbefore described, all as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

(C) The facilities hereby authorized shall be constructed and placed in actual operation and the sale and delivery of natural gas shall commence, as provided by paragraph (b) of Section 157.20 of the Commission's Regulations under the Natural Gas Act, within 1 year from the date on which this order issues.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

NATURAL GAS PIPELINE COMPANY OF AMERICA, DOCKET NO. CP62-174

FINDINGS AND ORDER ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued June 15, 1962)

On January 25, 1962, as supplemented on March 5, 1962, Natural Gas Pipeline Company of America (Applicant) filed in Docket No. CP62-174 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction and operation of a side tap and approximately 13.6 miles of 10-inch lateral pipeline replacing an equivalent length of 4-inch pipe on the DeKalb-Sycamore lateral in DeKalb Count, Illinois.

The lateral being replaced is part of 16 miles of 4-inch lateral pipeline extending from Applicant's 20-inch pipeline in Illinois to a point of connection with the facilities of Northern Illinois Gas Company (Northern), serving the communities of DeKalb and Sycamore, Illinois. The purpose of this replacement is to increase the capacity of pipelines serving these communities in order to meet expected increased requirements.

Applicant states that the described facilities have been constructed and were placed in operation October 17, 1961. Applicant states further that it is seeking authorization herein because of Commission order No. 241 issued January 12, 1962, in Docket No. R-205, 27 FPC 33, amending Section 2.55 of the Commission's Rules of Practice and Procedure.

The actual cost of construction is $349,415, which cost is being financed from funds on hand.

Applicant does not propose herein any change in its presently authorized daily contract quantities for Northern.

Pursuant to due notice, a public hearing was held in Washington, D.C., on June 5, 1962, respecting the matters involved in and the issues presented by the application, as supplemented, herein. No petition to intervene or protest to the granting of the application has been received. Staff counsel moved orally

at the hearing that the intermediate decision precedure be omitted and that the Commission render a decision herein pursuant to Section 1.30 (c) (1) of the Commission's Rules of Practice and Procedure.

The Commission finds:

(1) Applicant, Natural Gas Pipeline Company of America, a Delaware corporation having its principal place of business in Chicago, Illinois, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of October 13, 1942, in Docket No. G–235 (3 FPC 830).

(2) The facilities hereinbefore described, as more fully described in the application, as supplemented, in this proceeding, are to be used in the transportation and sale of natural gas in interstate commerce, subject to the jurisdiction of the Commission and the construction and operation thereof by Applicant are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(4) The construction and operation of the described facilities by Applicant are required by the public convenience and necessity and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a) and (e) of Section 157.20 of such Regulations.

(6) A request during the public hearing by staff counsel for omission of the intermediate decision procedure herein was unopposed by any party of record and, not having been denied by the Commission, is granted pursuant to Section 1.30 (c) (1) of the Commission's Rules of Practice and Procedure.

The Commission orders:

(A) A certificate of public convenience and necessity be and the same is hereby issued authorizing Applicant, Natural Gas Pipeline Company of America, to construct and operate the described facilities in order to sell and deliver natural gas to Northern, as hereinbefore described, all as more fully described in the application, as supplemented, herein, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a) and (e) of Section 157.20 of such Regulations.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

PUGET SOUND POWER & LIGHT COMPANY, PROJECT NO. 2150

ORDER APPROVING PROJECT EXHIBITS AND PRESCRIBING ADDITIONAL ANNUAL CHARGES

(Issued June 15, 1962)

On December 29, 1958, October 5 and October 19, 1960, Puget Sound Power & Light Company, licensee for major Project No. 2150, filed for Commission

approval Exhibits J, K, L and M for the Upper and Lower Baker River developments both of which are included under the license for the project. The licensee also requests that since the license includes both the Upper and Lower Baker River Developments, the license be amended to designate the entire project as the Baker River Project rather than as Upper Baker River Development as at present.

The project affects navigable waters of the United States and lands of the United States within the Mt. Baker National Forest.

The license for the project when issued, effective May 1, 1956, covered the then proposed Upper Baker River Development and the then constructed Lower Baker River Development, except for the United States lands occupied by the Lower development which were under license for minor-part Project No. 777 and lands of the United States occupied by the Upper development, which had not at that time been determined and described. Amendment No. 2 of the license, issued July 7, 1960, included thereunder the United States lands occupied by the Lower Baker Development, fixed the annual charges for such occupancy ($151.00, effective June 1, 1960), reserved the right to determine land charges for the Upper Baker Development when the extent of such lands had been determined, and accepted surrender of the license for minor-part Project No. 777.

The afore-mentioned exhibits show and describe the "as built" project facilities of both the Upper and Lower Baker Developments and the project area and boundary. Thus, approval of the exhibits will show as included in the license: (a) an earth-fill embankment to collect seepage flows from surface strata west of the West Pass Dike Area which are returned to the Upper Baker Development; (b) fish handling facilities to pass downstream migrant fingerlings; (c) 3,764.63[1] acres of lands of the United States occupied by the Upper Baker Development for annual charge purposes; (d) annual charges hereinafter fixed for such occupancy by the Upper Baker Development; (e) the West Pass auxiliary earth fill dike and two 700 horsepower electric motor pumps at the Upper Baker Development; and (f) the description of the license of the Upper Baker-Lower Baker 110 kv transmission line (not on lands of the United States) which was inadvertently omitted from the project description.

We are herein for the first time describing and including in the license the lands of the United States occupied by the Upper Baker Development and prescribing annual charges for such occupancy, effective from May 1, 1956, the effective date of the license, to June 1, 1960, in a specified annual amount, and thereafter in a specified increased annual amount for both the Upper and Lower Baker Developments.

The Department of the Army, Corps of Engineers, has reported that the plans of the structures affecting navigation are satisfactory and are approved and no additional terms and conditions in the interest of navigation are deemed necessary.

The Chief, Forest Service, acting for the Secretary of Agriculture, who has supervision over the Mt. Baker National Forest, has reported that the proposed project area as defined in Exhibits J and K will not interfere or be inconsistent with the purpose for which the Mt. Baker National Forest was created or acquired.

[1] This total includes 20.00 acres of United States lands of Schaddlers Island which should be included in the license, but does not include approximately 388.60 acres of lands conveyed to the United States under Forest Exchange Act of March 20, 1922 (42 Stat. 465) as amended February 28, 1925 (43 Stat. 1090), subject to perpetual (unlimited) flowage rights to the licensee and consequently not subject to annual charges under the Federal Power Act.

An Assistant Secretary of the Interior has reported that the layouts for the general fish facilities shown on Exhibits K and L are satisfactory with the understanding that some minor alterations may be made as shown to be necessary from study of continued operation of the facilities.

The Commission finds:

(1) The following described exhibits conform to the Commission's rules and regulations and should be approved as part of the license for the project, and the exhibits described herein as being superseded and which are now part of the license should be eliminated therefrom:

Exhibits J (FPC No. 2150-3) Revised August 1, 1960, superseding Exhibit J (FPC No. 2150-3); J. (FPC No. 2150-50) superseding J (FPC No. 2150-6); K–1 (FPC No. 2150-53); K–1A (FPC No. 2150-54); K-2 (FPC No. 2150-9) Revised August 1, 1960; K–3 (FPC No. 2150-10) Revised August 1, 1960; K–4 (FPC No. 2150-11) Revised August 1, 1960; K–1 (FPC No. 2150-26) Revised August 1, 1960; K–2 (FPC No. 2150-27) Revised August 1, 1960; K–3 (FPC No. 2150-55); J & K (FPC No. 2150-52); and J–2 of 2 (FPC No. 2150-51) which needs no approval since it is identical with J (FPC No. 2150-7) now part of the license; and

Exhibits L, Sheet 1 (FPC No. 2150-56) superseding L, Sheet 1 (FPC No. 2150-28); L, Sheet 2 (FPC No. 2150-57) superseding L, Sheet 2 (FPC No. 2150-5); L, Sheet 3 (FPC No. 2150-58) superseding L, Sheet 3 (FPC No. 2150-29); and

Exhibit M, (revised 9/1/60) supersedeing Exhibit M filed October 14, 1955.

(2) The amount of annual charges to be paid under the license for the purpose of recompensing the United States for the use, occupancy and enjoyment of its lands within the Mt. Baker National Forest by the Upper Baker Development is reasonable as hereinafter fixed and specified.

The Commission orders:

(A) The exhibits described in finding (1) above as conforming to the Commission's rules and regulations are approved as part of the license for Project No. 2150, and the exhibits described in the same finding as being superseded are eliminated from the license for the project.

(B) Finding paragraphs (4)(a) and (b) of the license for the project are modified to read as follows:

(4) The project hereinafter authorized, to be known as the Baker River Project, consists of:

(a) All lands constituting the project area and enclosed by the project boundary or the limits of which are otherwise defined, and/or interest in such lands necessary or appropriate for the purposes of the project, whether such lands or interest therein owned or held by the Applicant or by the United States; the general location of such project area and project boundary being shown and described by certain exhibits which formed part of the application for license or for amendment thereof and which are designated and described as follows:

Exhibit J: Revised (FPC No. 2150-3) General Map of Upper Baker River Development;

Exhibit J: (FPC No. 2150-50) General Map of Lower Baker River Development;

Exhibit J: (FPC No. 2150-7) General Map of Transmission Line;

Exhibit J & K: (FPC No. 2150-52) Map of Transmission Line Upper Baker River Development;

Exhibit K: (Supplementary) (FPC No. 2150 30 through -38) Detail Map of Transmission Line;

Exhibit K: (Supplementary) Sheet 5 (FPC No. 2150-49) Detail Map for Lower Baker River Development;

Exhibit K-1: (FPC No. 2150-53) Detail map of Project Area Lower Baker River Development;

Exhibit K-1A: (FPC No. 2150-54) Detail Map of Project Area Lower Baker River Development;

Exhibit K-2: (FPC No. 2150-9) Detail Map of Project Area Lower Baker River Development;

Exhibit K-3: (FPC No. 2150-10) Detail Map of Project Area Lower Baker River Development;

Exhibit K-4: (FPC No. 2150-11) Detail Map of Project Area Lower Baker River Development;

Exhibit K-1: (FPC No. 2150-26) Detail Map of Project Area Upper Baker River Development;

Exhibit K-2: (FPC No. 2150-27) Detail Map of Project Area Upper Baker River Development;

Exhibit K-3: (FPC No. 2150-55) Detail Map of Project Area Upper Baker River Development.

(b) Principal structures comprising—

(1) *The Lower Baker River development*, consisting of: (existing project works) a concrete gravity-arch dam having a spillway section surmounted by gates and splashboards and non-overflow sections at each end of the dam, creating a reservoir (Lake Shannon) with surface at elevation 438.52 feet (U.S.G.S.) and extending upstream about 7½ miles to the tailwater of the proposed Upper Baker River development; intake structure; pressure tunnel; surge chamber; penstocks; powerhouse containing two 27,000-horsepower turbines each connected to a generator rated at 21,950 kilovolt-amperes at 90 percent power factor; step-up transformers; two 110-kilovolt transmission lines connecting the transformers with the Applicant's existing Sedro-Woolley Substation; and appurtenant facilities; and (proposed project works) an extension of the pressure tunnel; surge tank; penstock; and extension of the existing powerhouse to contain a single 80,000-horsepower turbine connected to a generator rated at 64,000 kilovolt-amperes at 90 percent power factor; step-up transformer; fish handling, collection and passage facilities; and appurtenant facilities; and

(2) *The Upper Baker River development*, consisting of a concrete gravity dam located a short distance above the head of Lake Shannon reservoir, having a gated spillway section and a 12 foot roadway atop the dam, creating a reservoir about 9 miles long with highwater surface at about elevation 724 feet (U.S.G.S.); an earth and rock-fill dike at West Pass; an auxiliary earth-fill dike; two 700 horsepower electric motor pumps; powerhouse at the downstream toe of the dam containing two turbines each rated at about 60,000 horsepower at a net head of 275 feet and driving a 42,500 kilowatt generator; two penstocks; a step-up transformer; a 110 KV transmission line from Upper Baker substation to Lower Baker substation; fish handling, collection, passage and spawning facilities; and appurtenant electrical and mechanical facilities; the location, nature and character of which are more specifically shown and described by the exhibits hereinbefore cited and by certain other exhibits which also formed part of the application for license or for amendment thereof and which are designated and described as follows:

Exhibit L: (Supplementary) (FPC No. 2150-22) Showing general plan and profile of Lower Baker River development; (FPC No. 2150-39) showing plan and details of dam of the Lower Baker River development; (FPC No. 2150-40) Showing floor plan of powerhouse of Lower Baker River development; (FPC

No. 2150-41) showing cross sections of powerhouse of Lower Baker River development;

Exhibit L-1: (FPC No. 2150-56) Plans and Sections, Upper Baker River development;

Exhibit L-2: (FPC No. 2150-57) Plans and Sections, Upper Baker River development;

Exhibit L-3: (FPC No. 2150-58) Dike Plan and Sections, Upper Baker River development;

Fish Handling Facilities

Exhibit L: (Supplementary) Sheet 5 (FPC No. 2150-42) General Plan, Barrier Dam and Fish Trap; Sheet 6 (FPC No. 2150-43) Fish Trap and East Abutment, Plan and Sections; Sheet 7 (FPC No. 2150-44) Barrier Dam and Apron, Plan and Details; Sheet 8 (FPC No. 2150-45) Key Plan Fish Handling Equipment; Sheet 9 (FPC No. 2150-46) Longitudinal Section through Fish Trap; Sheet 10 (FPC No. 2150-47) West Abutment Wall and Miscellaneous Details; and Sheet 11 (FPC No. 2150-48) General Arrangement of Radial Gates.

Exhibit M: (Supplementary) Statement in ten sheets—General Description and Specifications of Equipment of the Lower Baker River Development (filed October 17, 1957); and

Exhibit M: (Revised September 1, 1960): General Description and Specifications of Equipment at Upper Baker River Development, comprising eight typewritten pages (filed October 5, 1960).

(C) Subparagraph (ii) of Article 40 of the license, as amended, is modified, effective as of May 1, 1956, to read as follows:

(ii) For the purpose of recompensing the United States for the use, occupancy, and enjoyment of its lands, $7,529.26 to June 1, 1960, and $7,680.26, thereafter.

(D) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313 (a) of the Federal Power Act and failure to file such an application shall constitute acceptance of this order. In the acknowledgment of the acceptance of this order, it shall be signed for the Licensee and returned to the Commission within 60 days from the date of its issuance.

LETTER REJECTING PROPOSED RATE SCHEDULE SUPPLEMENT AND RELATED PETITION TO AMEND CERTIFICATE ORDER

Docket No. G–15431

THE SUPERIOR OIL COMPANY

JUNE 15, 1962.*

THE SUPERIOR OIL COMPANY,
909 R.C.A. Building,
1725 K Street, N.W., Washington 6, D.C.
Attention: Mr. H. J. Penn.

GENTLEMEN: This is with reference to your letter of May 25, 1962, submitting (1) a supplemental agreement dated April 9, 1962, dedicating additional acreage, for filing as a proposed supplement to your FPC Gas Rate Schedule No. 77 and (2) a related petition to amend the order granting certificate in Docket No. G–15431 to include thereunder the additional acreage.

The additional sale is proposed to be made pursuant to a supplemental agreement dated April 9, 1962, which, in effect, incorporates by reference the terms

*Affirmed, 322 F. 2d 601 (CA9–1963) cert. den. 377, U.S. 922 (1964).

of a contract dated June 11, 1958. The supplemental agreement appears, therefore, to incorporate by reference pricing provisions other than those permitted by Section 154.93 of the Commission's Regulations. Therefore, in accordance with Commission Order No. 242 (copy enclosed), and Section 154.100 of the Commission's Regulations, the proposed rate schedule supplement and related petition to amend are hereby rejected. All available copies are returned herewith.

This rejection is without prejudice to the resubmittal of the subject filings upon deletion of the unacceptable provisions.

Very truly yours,

J. H. GUTRIDE,
Secretary.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

TIDEWATER OIL COMPANY, ET AL., DOCKET NO. G-13310, ET AL.[1]

ORDER CONDITIONALLY APPROVING GENERAL RATE SETTLEMENT PROPOSAL, SEVERING PROCEEDINGS, TERMINATING PROCEEDINGS AND REQUIRING REFUNDS

(Issued June 15, 1962)*

Syllabus

1. Commission conditionally *approves* rate settlement proposal; deems Examiner's decision moot; and terminates proceedings initiated under Sections 4(e) and 5(a) of the Natural Gas Act. P. 1270.

Robert E. Morse, Jr., J. Evans Attwell, Gene M. Woodfin, and *Robert Koch* for Tidewater Oil Company.

J. Harry Mulhern, Edward S. Kirby, and *William R. Duff* for Public Service Electric and Gas Company.

Vincent P. McDevitt, Samuel G. Miller, H. P. Sullivan, and *Ray Schroeder* for Philadelphia Electric Company.

William A. Dougherty, C. W. Cooper, George C. Williams, Norman A. Flaningam, Ray O. Martin, G. Kirby Harrington, James B. Sayers, and *Denton Borger* for Consolidated Natural Gas System.

J. David Mann, Jr., Thomas B. K. Ringe, and *Thomas Bracken* for United Gas Improvement Company.

Eugene J. Bradley for Philadelphia Electric Company.

Ray Schroeder for Public Service Electric and Gas Company.

John P. Randolph for United Fuel Gas Company.

Luke R. Lamb and *Alan J. Roth* for the Staff of the Federal Power Commission.

On March 28, 1962, Tidewater Oil Company (Tidewater) filed a petition requesting that the Commission issue an order approving a settlement proposal concerning the rates under 70 of its rate schedules[2] plus 55 related suspension

---

* Initial decision appears on page 1276. Modified by order issued July 11, 1962, 28 FPC 108.

[1] The other docket numbers are listed in Column 6 of Exhibit I. Some of the proceedings presently are consolidated with Docket Nos. AR61-2, *et al.*, and will be severed therefrom.

[2] Most of Tidewater's other rate schedules, not subject to the settlement proposal, will be subject to determinations in Docket Nos. AR61-1, *et al.*, should be terminated due to depletion of gas reserves, are in litigation, or are involved in pending certificate proceedings.

proceedings, three certificate proceedings, and a general rate investigation proceeding. The settlement proposal (attached hereto as Appendix A) was executed by Tidewater, Public Service Electric and Gas Company, The United Gas Improvement Company, The East Ohio Gas Company, Hope Natural Gas Company, New York State Natural Gas Corporation, The Peoples Natural Gas Company, and Lake Shore Pipe Line Company. All these parties also join in the petition for approval of the settlement proposal. No one has filed objections to the settlement proposal. The Public Service Commission of the State of New York filed preliminary comments to the proposal and a request for additional information. Philadelphia Electric Company and Texas Gas Transmission Corporation have also filed comments to the settlement proposal.

The settlement proposal provides for (1) rates generally at or below applicable area ceilings, (2) a two-year moratorium on rate increases above ceiling, (3) a post-moratorium limit on rate increases to one cent every four years, (4) waiver of the right to file for rate increases under indefinite pricing provisions in twelve rate schedules and (5) refunds based upon the difference between rates in effect subject to refund and the related settlement rates. Tidewater submits the proposal on condition that the proceeding in Docket No. G–13310 and the proceedings listed in Exhibit I hereto be terminated.

In support of the proposal, Tidewater states that the settlement provides for long-term price stability at rates generally conforming to established area rate standards, that the conclusion of the proceedings will release funds for exploratory and developmental activities and will relieve all parties of the costly and time-consuming effort of further pursuing the proceedings, and that the number of Tidewater's future filings for rate increases will be reduced by the moratorium on filings, by the post-moratorium limit on increases, and by the waiver of rights to file for indefinite price increases under twelve rate schedules.

One settlement rate which exceeds the ceiling is the proposed increased rate of 17.5¢ plus 1.75¢ tax reimbursement for a substantial sale of gas to United Gas Pipe Line Company (United Gas) from Hollywood Field, South Louisiana. The ceiling for increased rates in the area is 14.0¢ plus tax reimbursement (15.75¢ for this sale). In support of the proposed rate, Tidewater states as follows: During the course of drilling the discovery well in 1953, extremely high pressures were encountered and a dangerous blow-out and fire resulted. Although the well was later brought under control, it could not be shut in because of the pressures; an emergency sale was necessary to the only pipeline in the vicinity that had the capacity to take the some 35,000 Mcf per day that was being vented. A three-year contract was negotiated at a distress rate of 9.0¢ per Mcf plus 1.0¢ tax reimbursement. Shortly thereafter, on December 21, 1955, a renegotiated contract was executed providing for a rate of 18.5¢ plus tax reimbursement. The Commission suspended Tidewater's filing for the increased rate in Docket No. G–9932 and it became effective subject to refund on June 3, 1956. Under nearly identical circumstances the Commission has previously approved the settlement of a proceeding at the same rate of 19.25¢ per Mcf for a sale from acreage adjacent to Hollywood Field. *John W. Mecom*, 25 FPC 1022. We there noted that the increased rate was in the nature of an initial rate and was, at the proposed settlement level, compatible with the initial rate ceiling. We likewise approve Tidewater's proposed settlement rate.

However, Tidewater has proposed certain other rates which are in excess of ceiling and which accordingly should be reduced as follows: (1) The proposed settlement rates under Rate Schedule Nos. 5 and 18 are 15.34592¢ per Mcf (including tax reimbursement) for gas sold from Texas R. R. District No. 3.

That rate reflects a periodic increase from the initial rate and is above the ceiling for increased rates in the area. The rate should be reduced to the initial rate under the contracts of 15.144¢ per Mcf (including tax reimbursement), which is less than the ceiling for initial rates in the area. (2) The proposed settlement rates under Rate Schedule No. 26 are 21¢ per Mcf for reserves originally subject to the contract and 21.4¢ per Mcf for reserves later dedicated to the contract. These settlement rates are the initial rates under the rate schedule for the two classes of reserves. The 21.4¢ rate exceeds the initial rate ceiling of 21.25¢ (inclusive of tax reimbursement) for the area (South Louisiana); the proposed 21.4¢ settlement rate should be reduced to the ceiling level of 21.25¢. (3) The proposed settlement rate under Rate Schedule No. 57 is 14.3¢ per Mcf, after deduction of a 0.5¢ line amortization credit by the purchaser, for gas sold from Texas R. R. District No. 6. The total rate is thus 14.8¢ per Mcf, which exceeds the applicable 14.6¢ ceiling for increased rates under rate schedules from which favored-nation and redetermination price provisions have been eliminated. (Tidewater waives its rights under indefinite pricing provisions in this rate schedule.) The total settlement rate should be reduced to 14.6¢ per Mcf.

We recognize that the proposed settlement rates under Rate Schedule Nos. 5, 18 and 26 were previously accepted by the Commission, without suspension or condition, when originally filed by Tidewater. But we are now asked to approve these rates as part of the settlement proposal, and this we will not do in light of the recently established area rate standards. We shall therefore condition our approval of the settlement proposal to require Tidewater to reduce the rates as stated above.

Tidewater proposes that, on the basis of the settlement, the Commission terminate the certificate proceedings in Docket Nos G–16172, CI60–430, and CI61–171 applicable to Rate Schedule Nos. 75, 100, and 102. Tidewater is currently operating under these rate schedules on unconditioned temporary authorizations granted in the certificate proceedings. We note that the proposed settlement rates for each of these sales is less than the applicable initial rate ceiling level. However, Section 7 of the Natural Gas Act requires a hearing before the grant of permanent certificates, and we therefore cannot dispose of these certificate matters by settlement. We propose instead promptly to set these certificate matters for hearing and will modify the settlement proposal consistent with the foregoing.

On September 14, 1961, the Presiding Examiner issued his initial decision in the Section 5(a) proceeding in Docket No. G–13310 and the consolidated Section 4(e) proceedings in Docket Nos. G–9932, G–9241, G–9551, G–9552, G–9608, G–10998, G–11318, G–11319, G–11340, G–11357, G–11907 and G–12999. Tidewater proposes that all these proceedings (and others) be disposed of under the settlement. In his decision, the Presiding Examiner dismissed the Section 5(a) proceeding, declining to set future rates for Tidewater, and disallowed the rate increases subject to the consolidated 4(e) proceedings upon a finding that company-wide test jurisdictional revenues exceeded costs by more than the rate increases. Philadelphia Electric Company, the Public Service Commission of the State of New York, and certain signatories to the settlement proposal have commented favorably on the Examiner's cost analysis. However, we approve of and want to encourage settlements which dispose of most of a producer's pending rate problems, which do so in accord with our area rate ceilings,[3] which provide for a reasonable moratorium on increased

[3] *Statement of General Policy No. 61–1*, 24 FPC 818, as amended.

rate filings, which require refunds where appropriate, which lend certainty to the purchased gas costs of buyers, and which free the producer's revenues from contingencies that no doubt inhibit exploratory and developmental activities. Tidewater's settlement proposal in general provides all these substantial benefits and thus goes well beyond the Examiner's decision. Without passing on the validity of the Examiner's decision, we find that the public interest will best be served by approving Tidewater's settlement proposal, with certain modifications and conditions. The Examiner's decision accordingly becomes moot.

Our approval of the settlement proposal should not be construed as constituting approval of any future rate increases that may be filed under the subject rate schedules and is without prejudice to any findings or orders of the Commission in any further proceedings, including area rate proceedings, involving Tidewater's rates and rate schedules.

The Commission finds:

(1) The settlement of the proceeding in Docket No. G–13310 and the proceedings listed in Column 6 of Exhibit I hereto—other than Docket Nos. G–16172, CI60–430, and CI61–171—on the basis of the settlement proposal submitted by Tidewater and others, as hereinafter modified, is in the public interest in carrying out the provisions of the Natural Gas Act and should be approved and made effective subject to the terms and conditions ordered.

(2) Rates under the rate schedules subject to the settlement should be disallowed to the extent they exceed the settlement rates as modified.

(3) The proceedings listed in Column 6 of Exhibit I which are now consoli dated with Docket No. AR61–2, *et al.*, should be severed therefrom.

(4) The decision of the Presiding Examiner in Docket No. G–13310, *et al.*, should be deemed to be moot.

The Commission orders:

(A) The settlement of these proceedings on the basis of the settlement proposal attached hereto as Appendix A is approved and made effective subject to the following modifications, terms and conditions.

(B) Tidewater shall substitute, in lieu of the related proposed settlement rates, rates of 15.144¢ per Mcf under its FPC Gas Rate Schedule Nos. 5 and 18; 14.6¢ per Mcf, including 0.5¢ deducted by the purchaser, under its Rate Schedule No. 57; and 21.25¢ for the sale of additional acreage dedicated in Supplement No. 5 under its Rate Schedule No. 26.

(C) The certificate proceedings in Docket Nos. G–16172, CI60–430, and CI61–171 shall not be terminated on the basis of the settlement but shall be determined after hearing. Tidewater shall file an amended application in Docket No. G–16172 in conformity with the proposed settlement rate. Tidewater shall abide by ultimate Commission decision, after judicial review if any, in these certificate proceedings. The involved rates and rate schedules shall otherwise remain subject to the terms of the settlement.

(D) Rates under the rate schedules subject to the settlement are hereby disallowed to the extent they exceed the settlement rates listed in Column 5 as modified according to paragraph B above. Within 45 days from the date of this order Tidewater shall refund with interest as specified in each docket the difference between all charges collected under the subject rate schedule at rates in effect subject to refund and the lesser charges that would have been collected at the related settlement rates as modified according to paragraph B above.

(E) Within 45 days after the date of this order Tidewater (1) shall make such filings under its rate schedules as are required to make effective the terms of settlement proposal, as modified according to paragraph B above, and (2) shall report to the Commission, in writing and under oath, the amount of refund made to each of its purchasers, showing separately the amount of principal and interest so paid and the bases used for such determinations, together with releases from its purchasers showing receipt of the refunds in conformity to the settlement as modified and approved.

(F) Tidewater shall, over the signature of a responsible officer, file with the Commission, within 30 days from the date of issuance of this order, in writing and under oath, an original and one copy of its acceptance or rejection of the terms and conditions of this order.

(G) The rate proceedings in Docket Nos. G–13378, G–13386, G–13436, G–13580, G–16593, G–16594, G–17998, G–17999, G–18751, G–19646, G–19647, G–20011, RI61–124, RI61–125, RI61–159, RI61–292, and RI61–297 and the certificate proceedings in Docket Nos. G–16172, CI60–430, and CI61–171 are hereby severed from the consolidated proceedings in Docket No. AR61–2, *et al.*

(H) Upon full compliance by Tidewater with all the terms and provisions of this order and of the settlement proposal as hereby modified and approved, the proceeding in Docket No. G–13310 and the proceedings listed in Column 6 of Exhibit I—other than Docket Nos. G–16172, CI60–430, and CI61–171—shall terminate, and the Presiding Examiner's decision issued on September 14, 1961, in Docket No. G–13310, *et al.*, shall be deemed to be moot.

(I) This order is without prejudice to any findings or orders which have been or may be made hereafter by the Commission, and is without prejudice to claims or contentions which may be made by the Commission, Tidewater, the Commission staff, or any affected party herein, in any proceedings now pending or hereafter instituted by or against Tidewater or any other companies, persons, or parties affected by this order.

EXHIBIT I

TIDEWATER OIL COMPANY

[1] Louisiana and Mississippi prices are at a pressure base of 15.025 PSIA, all other prices are at 14.65 PSIA.
[2] An additional 0.5¢/MCF is received for gathering and dehydration on the Richter Unit.
[3] Increase has not been effective subject to refund.
[4] Includes 0.5¢/MCF for gathering and dehydration.
[5] 13.45435¢/MCF when well P & A.
[6] After deduction of 0.5¢/MCF line amortization charge.
[7] 23.55 when well P & A.
[8] Effective until deliveries ceased on Apr. 5, 1960.
[9] In addition Seller receives 1¢/MCF for gathering & dehydration.

DECISION

UPON A CONSOLIDATED PROCEEDING UNDER SECTIONS 4(e) AND 5(a) OF THE NATURAL GAS ACT TO DETERMINE JUST AND REASONABLE RATES FOR AN INDEPENDENT PRODUCER

(Issued September 14, 1961)

ZWERDLING, *Presiding Examiner:* This consolidated proceeding involves (1) a review under Section 4(e) of the Natural Gas Act concerning the lawfulness of 15 rate increases relating to the sale of gas by Tidewater Oil Company (Tidewater) under eight different contracts from fields in South Louisiana and the Texas Gulf Coast area and (2) an investigation under Section 5(a) of the Act of the rates charged by Tidewater in connection with all of its sales of natural gas subject to the jurisdiction of the Federal Power Commission.

Tidewater is a major, integrated oil company engaged in virtually all phases of the petroleum industry, including the exploration for and the development, production and sale of crude oil and natural gas; the purchase of crude oil from other producers; the refining of crude oil and other petroleum products; the transportation of crude oil and liquid products through company-owned pipelines and tankers; the sale of refined petroleum products at wholesale and retail; the processing of natural gas in gasoline plants; and the exploration for uranium and other operations (Exhibit 144). Operations are conducted throughout the United States and in many foreign countries. Foreign exploration operations are, or have been conducted in Canada, Iran, Turkey, Guatemala, Paraguay and Pakistan (Exhibit 144). At the time these hearings commenced, Tidewater's revenues from gas sales constituted only 2% of total revenues. (1:257)

Tidewater has virtually no dry gas production and in this respect it differs from some other major producers, who produce large quantities of dry gas in relation to their total gas production. The company's principal gas properties are located in the newer gas-condensate producing areas of South Louisiana and the Texas Gulf Coast at depths below 5,000 feet.

Tidewater conducts its domestic exploration and production activities in three divisions: Western, Central and Southern. Its jurisdictional gas sales are made entirely from the Central and Southern divisions—in Kansas, Louisiana, Mississippi, New Mexico,' Oklahoma, Texas, and West Virginia. (Exh. 137) However, 87 percent of its gas reserves are located in its Southern Division. Because the company's jurisdictional gas sales are made entirely from the Central and Southern Divisions, the cost-of-service studies presented by Tidewater and the intervenors in this proceeding have confined solely to those Divisions.

The first stage of this proceeding involved only Docket No. G–9932, relating solely to the Section 4(e) increase in price for gas sold to United Gas Pipe Line Company by Tidewater from the Hollywood Field, Terrebonne Parish, Louisiana—and hearing on this initial phase of the proceeding commenced on May 28, 1956. After several hearing sessions had been held in Docket G–9932, the Commission by order issued September 27, 1957, consolidated that Section 4(e) proceeding with a pending Section 5(a) investigation of all Tidewater's jurisdictional gas rates, and at the same time also consolidated 11 other pending Section 4(e) dockets relating to 14 rate increases.

The proposed Section 4(e) rate increases included in the consolidated proceeding involve the following:

Field Parish or County purchaser	Docket No.	Rate schedule No.	Supplement No.	Date filed	Existing price	Increased price per contract	Amount of increase

(Tidewater Initial Brief, p. 6)

As in the *Phillips* case (Op. 338), the instant proceeding was presented by all parties on a cost-of-service basis, although Tidewater in addition presented certain evidence relating to trends in industry costs, trends in production, exploration and development, and evidence of current market prices. Evidence was presented by Tidewater, an intervenor group (consisting of Philadelphia Electric Company, Public Service Electric and Gas Company, and The United Gas Improvement Company) and the Commission Staff.[1] In the initial part of the proceeding Tidewater, the intervenors and the Staff presented cost-of-service studies based on the test year 1955. At a subsequent stage of the proceeding in 1959 Tidewater made a new cost-of-service presentation based upon the more recent test year of 1957, and the intervenors thereafter followed with a cost-of-service presentation of their own based upon the 1957 test year. Although the Commission Staff presented its case only upon the basis of the 1955 test year, the Staff briefs rely upon the 1957 data presented by the other parties.

Tidewater presented its 1957 cost studies in Exhibits Nos. 128 and 129 (with illustrative variations in other exhibits). The intervenors presented their 1957 cost-of-service study in Exhibit No. 150, subsequently revised in Exhibit No. 180.

Hearings in the consolidated proceedings concluded on May 23, 1960, and the record includes 7,587 pages of testimony, 180 exhibits, and a number of items by reference. The lengthy period over which the trial of this case was spread resulted from a number of factors, including the following:

(1) A Section 5(a) proceeding was added to the case in midstream.

(2) The landmark *Phillips* producer rate case was being tried throughout the same period, and all parties regarded it as useful to take advantage of the opportunities to learn from and react to the developments in that case.

(3) The resultant time lag since the initial presentation of the case on a 1955 test year basis made it necessary to shift at a late stage of the proceeding to a 1957 test year.

Under all the circumstances, there can be no doubt that the more recent test year of 1957 should be used in fixing Tidewater's rates for the future, and the case will therefore be discussed on that basis.

[1] There were in addition 49 non-active intervenors. Hereafter the term "intervenors" will be used to refer to the participating intervenor group listed above.

Tidewater contends that its cost-of-service for the Southern and Central Divisions based upon the test year 1957 was substantially in excess of its natural gas revenues for that year, and that it therefore suffered a substantial revenue deficiency. On the basis of this conclusion, Tidewater requests that its consolidated Section 4(e) rate increases should be approved and that the pending Section 5(a) investigation should be dismissed. It does not, however, request the Commission to raise its jurisdictional gas revenues above the levels provided in its contracts, in order to equal its claimed cost-of-service. The intervenors and the Staff, on the other hand, constructing a cost-of-service for Tidewater under different methods, both derive a total cost-of-service for Tidewater substantially lower than its jurisdictional revenues for the test year 1957.

THE SIGNIFICANCE OF THE INSTANT CASE

The importance of the instant Tidewater proceeding lies in the fact that it is only the second major producer rate case to reach the point of decision before the Commission since the Supreme Court held in 1954 that the Federal Power Commission has jurisdiction and responsibility to regulate independent producers of natural gas.[2] In the Commission's historic Phillips decision (Op. 338), issued September 28, 1960, 24 FPC 537, it reached and expressed certain general conclusions with respect to the usefulness of the cost-of-service method as applied to producer rate proceedings. Among other things the Commission concluded, on the basis of its experience up to that time, that

> . . . regulation of producers on a company-by-company rate basis method will in all probabilty result in higher consumer prices than we would otherwise have. Since the cost rate base method seems almost always to produce the higher rates it appears that consumers, in most instances, will be thoroughly protected if we place more reliance on existing prices and on applicable economic principles. (Op. 338, p. 546)

This conclusion was based upon the experiences which the Commission had encountered up to that time in a number of minor producer cases, involving relatively small producers, which were tried and decided on an *ad hoc* basis. It was also based upon the fact that in the *Phillips* case itself, employing the cost-of-service methods and techniques there approved, the Commission found that Phillips' total system-wide cost-of-service exceeded the total revenues which it was then collecting under existing contracts, and that Phillips accordingly was suffering a revenue deficiency. This situation resulted, in part, from the fact that Phillips had an unusually large number of old contracts, under which gas was still being delivered under abnormally low prices.

No such circumstances are involved in the instant Tidewater proceeding. The importance of the Tidewater case is that it provides a more solid base for the consideration of these problems than was available to the Commission when it issued its *Phillips* decision. The Commission will therefore undoubtedly desire to weigh and consider the experience, the evidence and the results obtained in the instant Tidewater proceeding, in connection with its continuing effort to exercise its responsibility to resolve the problem of producer rate regulation.

In making this evaluation, the Commission will of course recognize that the price results flowing from the use of a "cost-of-service" method will depend to a major extent upon the techniques which are adopted for the construction of the producer's cost-of-service. If the cost-of-service is constructed under the techniques generally advocated by the producers themselves, it will undoubtedly

[2] *Phillips Petroleum Co. v. Wisconsin*, 347 U. S. 672.

reach an extremely high level and may well exceed field prices. On the other hand, if the cost-of-service is constructed under the methods and techniques approved by the Commission, after careful and extended consideration, in the *Phillips* case, then the experience gained in the instant Tidewater proceeding would appear to demonstrate that the price results will be at a substantially lower level than field prices.

It is important and of interest to recognize at the outset that the major, dollar-impact differences between the types of price levels derived under the cost-of-service techniques advocated by the producers, on the one hand, and those approved by the Commission in *Phillips*, lies mainly in the treatment adopted for a small number of key, basic problems, as follows:

(1) *Allocation of Joint Production Costs Between Liquids and Gas*

Tidewater here advocates the use of the straight Btu method, which results in allocating 25.26 percent of joint production expenses to gas. As will be developed subsequently in this decision, application of the relative cost method approved by the Commission in *Phillips*, as modified in some aspects to reflect operating problems peculair to Tidewater, results in an allocation of 5.98 percent of Tidewater's on-lease production expense to gas.

(2) *Allocation of Exploration Costs Between Liquids and Gas*

Generally, in proceedings pending before the Commission up to this time, producers have advocated the use of the straight Btu method, which results in allocating anywhere from 40 percent to 60 percent of exploration costs to gas. In the instant Tidewater proceeding this method would result in an allocation of 43.07 percent to gas. In *Phillips*, however, the Commission approved a modified Btu method, using an economic adjustment factor of four to reflect relative market prices of liquids and gas—resulting in an allocation of 32.742 percent to gas. In the instant Tidewater proceeding, the use of the modified Btu method, even if modified to reflect an adjustment factor of three (which, of course, would be more favorable to the producer), results in an allocation of 24.17 percent to gas.

(3) *Income Tax Allowance and Rate of Return*

In *Phillips* the producer claimed either actual taxes plus a 17-18 percent rate of return, or in the alternative a rate of return of 12 percent, in addition to the benefits of the statutory tax allowances. In the instant proceeding, Tidewater claims either actual taxes plus a 25 percent return, or in the alternative a 12 percent return plus the benefits of the statutory tax allowances. In *Phillips* the Commission approved a rate of return of 11 percent and allowed only actual tax liability.

In the instant proceeding Tidewater derives a total unit cost-of-service for gas of 35.72 cents per Mcf, employing techniques which have already been rejected by the Commission in *Phillips*. However, the instant decision, applying the methods and techniques approved by the Commission in *Phillips* (with some modifications as referred to above) derives a total jurisdictional gas cost-of-service for Tidewater in the amount of 11.45 cents per Mcf.

It is finally important to recognize that the difficult and basic issues refered to above, which necessarily arise in connection with the application of a cost-of-service method to the producers, and which necessarily consumed so much time and energy in the *Phillips* case and in the instant Tidewater proceeding, have now been finally resolved by the Commission in its *Phillips* decision. Accordingly these problems need no longer be the subject of further prolonged controversy.

We turn now to a discussion of the major cost-of-service issues which must be resolved in the instant Tidewater proceeding.

ALLOCATION OF JOINT PRODUCTION COSTS

In this proceeding, as in the *Phillips* case, a great deal of time and attention was devoted by the parties throughout the hearing to the question as to how joint production costs of the joint product leases should be allocated between liquids and gas. That important and basic question has now been firmly resolved by the Commission in its *Phillips* decision, where it adopted and approved the use of the *relative cost method* for this purpose. The Commission there stated:

> This method allocates the actual costs of joint oil and gas production in proportion to the known costs of producing each product separately. (Op. 338, p. 553)

In the *Phillips* case the unit cost for dry gas was determined from the records of Phillips' Natural Gas Department; and the unit cost for oil was obtained from the records of Phillips' Production Department relating to 100 percent oil leases.[3] The mechanics of the relative cost allocation process as applied in the *Phillips* case were described by the Commission in Op. 338 as follows:

> These unit costs for the two products are multiplied by the volumes of oil and gas produced on the joint product leases. This provides a tentative total relative cost for the oil and gas produced from such leases and a ratio of tentative gas cost to tentative total cost. This ratio is then applied to the total actual cost of he joint product leases to obtain the cost of the jointly produced gas. (p. 553)

It is concluded that here, as in the *Phillips* case, the relative cost method is preferable to any other suggested method for the allocation of joint production costs between liquids and gas, for the reason that cost allocations should be based, if possible, upon the factors which affect the various costs under consideration. The relative cost method has the advantage, over all other methods suggested for this purpose, of being a composite evaluation of all these factors without requiring a separate evaluation of each one. The logic of the relative cost method is succinctly and fairly stated in the intervenors' initial brief as follows:

> The logic of the relative cost method is that the physical characteristics of natural gas on the one hand and of liquids on the other affect their separate recovery from underground reservoirs and hence the incurrence of cost in connection therewith; and that the same physical characteristics affect the joint recovery and hence the joint cost incurrence involved in recovering them when they occur together in the reservoir. As is generally recognized and as in any event the Tidewater data made clear (T. 6774–6775), it is cheaper to raise liquid hydrocarbons from reservoirs in which they are found in conjunction with gas, the reasons being that the gas gas provides a source of energy for recovery of the liquids and modifies the physical characteristics of the liquids in such a way as to make their recovery easier, cheaper, and more complete than it otherwise would be: cf. Transcript pp. 1503-1540. It is logical, therefore, to divide the benefits of this efficient operation in some proportionate and equitable shares between the various products produced (T. 1677). The relative cost

[3] In order to obtain the unit cost for the 100 percent oil leases in the *Phillips* case it was necessary, among other things, to make an allocation of indirect expenses between the 100 percent oil leases and the joint product leases in Phillips' Production Department.

> method at least approaches this proportionate sharing since it depends upon what it apparently costs, or did cost to produce each product separately (T. 1677). (pp. 20-21)

Application of the relative cost method in the instant proceeding involves a particular problem not encountered in the *Phillips* case arising from the fact that Tidewater does not produce dry gas in any significant quantity. During the 1957 test year dry gas production accounted for less than 1 percent of Tidewater's total gas production and less than 1 percent of its test year gas revenues. (Exhibit 132, Sched. 5) Intervenor witness Kahn ultimately resolved this problem by developing a gas leg in which he combined with the few leases producing gas only in 1957, a "preponderantly gas" lease sample, composed of gas-condensate leases in which gas was the preponderant product —*i.e.*, where the wells contained 100 Mcf of gas or more per barrel of liquids, and in which gas revenues greatly exceeded liquid revenues.[4]

Tidewater's Btu Method

Tidewater contends that, because it has no substantial dry gas production, the relative cost method employed in the *Phillips* case is particularly unsuitable here; that its own experience provides no reliable figure on which to base the relative cost method of allocation in the instant proceeding.

Tidewater thereupon contends that its joint production costs should be allocated under the Btu method (*i.e.*, in proportion to the test year Btu production of each product)—"at least insofar as its gas-condensate properties are concerned". (initial brief, pp. 44–46; reply brief, pp. 24–28) In connection with this position, Tidewater stresses the fact that "by far the most important segment" of its gas production operations consists of production from gas-condensate leases, noting that in the test year 1957 its gas-condensate properties produced 64.80 percent of its total gas production and accounted for 74.46 percent of its total gas revenues. (Exhibit 132, Shed. 5) Tidewater contends that this preponderance of gas-condensate production

> . . . necessitates the use of an allocation method for production and exploration costs which recognizes the physical fact that gas-condensate reservoirs exist wholly in the gaseous phase. (reply brief, p. 25)

Tidewater's position with respect to the physical facts governing the operation of gas-condensate reservoirs and the conclusions to be drawn therefrom is set forth as follows:

> These gas-condensate leases are produced from reservoirs which contain hydrocarbons in the gaseous form at high pressure. When this single homogeneous substance is brought to the surface and the pressure reduced, it separates into liquids and gas. It is only after the production process is completed and all production costs have been incurred that the single gaseous form of hydrocarbons is divided into separate products (liquids and gas). In short, gas and liquids are in the *same form* throughout the incurrence of the joint production costs. The fact that the components of this wet gas stream are used for different purposes and have different values subsequent to completion of the production process does not change the fact that the production costs associated with one Mcf of such single homogeneous product are indistinguishable from the production costs associated with any other Mcf. (initial brief, p. 44)

* * * * * * *

[4] The rationale supporting the use of this gas leg, and the Tidewater criticism thereof, will be discussed at length at a later point.

> These physical and operating facts conclusively show that for gas-condensate production the BTU method of allocation most closely approximates the actual incurrence of production costs. Therefore, since the allocation problem in this case relates principally to joint production costs incurred in connection with Tidewater's gas-condensate production, the BTU method of allocation is appropriate. . . . (initial brief, p. 45)

The obvious and complete answer to this Tidewater position lies in the fact that the Commission in its *Phillips* decision, in allocating joint production costs, applied the relative cost method uniformly and without differentiation to Phillips' gas-condensate leases as well as to its casinghead gas-oil leases. This was in spite of the fact that the greatest part of Phillips' production from joint product leases came from gas-condensate leases.[5] Although Tidewater in support of its instant position emphasizes the large proportion of its total gas production which comes from gas-condensate leases, it is interesting to note that Phillips' 1954 production of gas from gas-condensate leases, amounting to 78,499,506 Mcf, was substantially higher than Tidewater's 1957 gas production from gas-condensate leases, which amounted to 61,695,657 Mcf. (Tidewater reply brief, p. 24)

Tidewater attempts to play down the significance of the Commission's use of the relative cost allocation method in the *Phillips* case by noting that Phillips' production of gas from joint product leases amounted to only 19.01 percent of its total gas produced *and purchased* in 1954. Tidewater therefore suggests that any possible errors inherent in the use of the relative cost method could not in any event have had any very great impact upon the ultimate result in that case; that accordingly the use of the relative cost method provided no cause for serious concern in the *Phillips* case. By contrast, Tidewater notes that any possible errors inherent in the relative cost method could have a very substantial impact in the instant proceeding by virtue of the fact that it would here be applied to 99.43 percent of Tidewater's total 1957 gas sales, this being the percentage of its 1957 gas production coming from joint product leases.

This Tidewater argument is without merit. It may first be noted that the comparative figures used here by Tidewater create a rather distorted impression. Since we are dealing here with the problem of allocating the cost of gas *produced* from joint product leases, it is difficult to see the relevance of the fact that only 19.01 percent of the gas produced *and purchased* by *Phillips* in 1954 consisted of its own production from joint leases. A far more relevant statistic may be obtained by noting that 39.7 percent of Phillips' own 1954 gas *production* came from its joint product leases. Furthermore, it is perfectly clear that the Commission in its *Phillips* decision approved the use of the relative cost method for the allocation of joint production costs *as a matter of principle* (Op. 338, p. 553, *et seq.*) and there is no basis whatsoever for the inference that this approval was given grudgingly or with reservations.

In further support of its instant position, Tidewater (initial brief, pp. 45-46) quotes certain language used by the Commission at page 33 of its *Phillips* decision, in connection with the Commission's discussion at that point of the problem of distributing wet gas stream costs between extracted liquids and residue gas. Tidewater contends that this quoted language establishes the validity of the Btu method in the instant proceeding "at lease insofar as its gas condensate properties are concerned." (initial brief, p. 46) It is concluded,

[5] 20.9 percent of Phillips' 1954 gas production was from gas-condensate leases, with only 18.8 percent coming from casinghead gas-oil leases. The remaining 60.3 percent of production was from dry gas leases. (Tidewater reply brief, p. 24)

however, that this quoted language from the *Phillips* decision is totally irrelevant here. The problem of allocating joint *production* costs between gas and liquids, which is governed by the relevant engineering facts, involves quite different factors and considerations than the problem of distributing the costs of a wet gas stream entering an extraction plant between extracted liquids and residue gas. Furthermore, it is difficult to see how the *Phillips* decision can seriously be cited as authority for the instant Tidewater position when the Commission in that case, after employing the Btu method for allocation of wet gas stream costs between extracted liquids and residue gas, nevertheless used the *relative cost* method for allocation of the joint *production* costs of Phillips' gas-condensate leases, which amounted to 20.9 percent of its test year gas production.

As noted above, the entire Tidewater thesis here is that its gas-condensate production operations are marked by certain special and peculiar characteristics which allegedly render it inappropriate to apply to gas-condensate leases the same allocation method which may be regarded as suitable for the casinghead gas-oil leases. The special characteristic thus cited for the gas-condensate leases lies in the fact that they produce a single homogeneous substance, *in gaseous form;* and that it is only *after* the production process has been completed and all production costs have been incurred that the single gaseous form of hydrocarbons is divided into separate products (condensate liquids and gas).

However, it is important to note that the same situation applies with equal force to the casinghead gas-oil leases, where the gas is dissolved in the oil in the reservoir, and is first separated from the oil in the trap or separator which is usually located at the well or at tank batteries. The only difference lies in the fact that in gas condensate leases the single homogeneous substance is in the form of a vapor, or gas, until it reaches the surface—when a portion of the vapor condenses into liquid condensate upon the reduction of the pressure. The situation with respect to the casinghead gas-oil leases is the reverse—*i.e.*, the single homogeneous, substance in the reservoir is in the form of a liquid. When it comes to the surface, the gas is separated from the oil as a result of pressure reduction.[6]

As already noted above, the Commission in *Phillips* recognized no relevant difference between these two situations, and accordingly employed the same relative cost allocation method of joint production costs both in the case of single phase production of the gas-condensate (vapor) variety and single phase production of the casinghead-oil (liquid) variety.

As a matter of fact, the distinction sought to be made here by Tidewater between crude oil and condensate is largely a matter of semantics. In the stock tank, condensate *is* in effect a light, non-asphaltic *crude oil* of 45° APL or higher. As the Commission itself stated in *Phillips*,

> The contents of some of the recently developed gas-condensate reservoirs exist wholly in the gas phase; and a portion of the gas condenses naturally during the production process *into a liquid that is separated and sold as light crude oil.* (Op. 338, p. 559; emphasis supplied)

Similarly,

> . . . condensates produced from deep reservoirs are undistinguishable from nonasphaltic light crude oil . . . they are crude oil. (Stuart E. Buckley, *Petroleum Conservation*, AIMME, 1951, p. 106)

---

[6] See testimony by intervenor witness Botset in the instant proceeding at 10:1524–25; testimony by Phillips witness Tarner in the *Phillips* case, 56:7902–3; Smith- Wimberly Report, Natural Gas Investigation, Docket No. G–580 (1948), at pp. 71–76, and 108.

Phillips witness Tarner testified in the *Phillips* hearing as follows:

> In most cases we handle the condensate as an oil. It is stored and sold in the same manner, *and it is sold on the same price basis as an oil.* (Phillips, 56:7905; emphasis supplied)

The fact is that condensate is, like crude oil, a primary source of gasoline and gasoline components. Condensates, after separation, are handled like other crude oils and are employed in the making of gasoline, jet fuel, kerosine, chemical materials, and other *non-heating* products.[7]

In the *Phillips* case the Commission rejected the *straight Btu method* for the allocation of exploration costs between oil and gas, stating:

> . . . such a method reflects only in part the potentialities of the hydrocarbon products. Oil and gas are not produced, purchased and used merely on the basis of Btu content or available energy. The transportation, refining, distribution and utilization factors are equal to or greater than the factors of exploration and development. As the examiner explains, the chief function of the oil industry is to provide fuel for transportation. Oil and its component, gasoline, are basically useful because they provide energy in compact, mobile and easily controlled liquid form. Actually, the heavier the crude oil, the higher will be its Btu content but the lower will be its gasoline content and its price. Gas, on the other hand, does not have the mobility of oil, for it must be carried in pipelines under pressure and used under limited conditions. Both oil and gas are used for the manufacture of chemicals and plastics which could not be properly compared on the basis of Btu. Thus if the Btu method is to be made practicable and useful for the allocation of costs it must be modified by the exercise of judgment based on the facts and the principles that guide producers in the incurrence of costs. (Op. 338, p. 556-557)
>
> * * * * * * *
>
> . . . exploratory activities are directed to obtaining saleable products so that it seems reasonable that market relationships should also be reflected in the allocation. Furthermore, developmental activities are directed towards the production of known reserves and such activities would reflect market conditions. (Op. 338, p. 559)

Accordingly, the Commission in the *Phillips* case concluded that an economic factor of four (based upon and reflecting the ratio of the price of a barrel of petroleum to an Mcf of gas at the wellhead) must be applied to the straight Btu content of oil, as an adjustment factor for the Btu ratio

> that will have the effect of correcting its unreality and of avoiding imposing costs on gas consumers which should fairly be borne by the consumers of the ultimate products of the crude oil but also require gas to bear its proper share of the costs. (Op. 338, p. 560)

These identical objections to the straight Btu method are applicable with equal force to its use, as here proposed by Tidewater, for the allocation of joint *production* costs between liquids and gas. In view of the facts as developed above with respect to the nature and uses of *condensate*, such defects are equally obvious and equally fatal regardless of whether we are dealing with casinghead gas-oil leases, or with gas-condensate leases.

It is therefore concluded that there is no valid basis for adopting the Btu method, as proposed by Tidewater, for allocation of the joint production costs of its gas-condensate leases; that, on the other hand, the relative cost alloca-

[7] 1958 Minerals Yearbook, Vol. II, Fuels, pp. 329–346.

tion method *does* constitute an appropriate and acceptable way to measure the relative roles of the condensate and the gas in the incurrence of joint production costs on the gas-condensate leases, as it does in the case of the casinghead gas-oil leases. It will be recalled that at an earlier point, in explaining the rationale of the relative cost allocation method, it was noted that it is cheaper to raise liquid hydrocarbons from reservoirs in which they are found in conjunction with gas, since the gas provides a source of energy for recovery of the liquids and modifies the physical characteristics of the liquids in such a way as to make their recovery easier, cheaper and more complete than it would otherwise be. It was concluded that the relative cost allocation method represents a logical and appropriate manner in which to divide the benefits of this efficient operation in some proportionate and equitable shares between the various products produced.

The same situation applies with even greater force to the gas-condensate leases, since in some respects natural gas helps even more in the recovery of condensate than in the recovery of crude oil. Because of the very large volume of gas present per barrel of condensate in the gas-condensate leases, the liquid is actually "dissolved" in the gas phase and exists as a vapor. Since the condensate thus occurs in vapor form, it does not exhibit its usual (liquid) properties of surface tension and wettability and is not subject to the retentive force of capillarity in the reservoir pores. Accordingly, a high degree of recovery of the condensate is possible.[8] If the condensate existed by itself in the reservoir, it would be in liquid form (as a light crude oil) and would have to be recovered as a liquid, and its recovery, absent the lifting effect of gas, would be correspondingly more difficult.

In view of the facts as outlined above, it would be ironic if in the case of the gas-condensate leases, where gas makes an even more important contribution to the production of the liquids than in the case of the casinghead gas-oil wells, we were nevertheless to adopt an allocation method—*i.e.*, the Btu method as proposed by Tidewater—which charges a far higher ratio of joint production costs to the gas than is obtained under the relative cost method which is applied to the casinghead gas-oil wells. It should further be noted that the adoption of any such anomalous position with respect to the gas-condensate leases, as proposed by Tidewater, would have the most serious results here in view of the fact that Tidewater's gas-condensate properties produced approximately two-thirds of its total gas production for the year 1957 and accounted for more than two-thirds of its total gas revenues.

Tidewater's Use of Omnibus Relative Cost Factors

As earlier noted, Tidewater contends that because it does not produce dry gas in any meaningful quantity, its own experience provides no reliable figure on which to base the relative cost method of allocation; that, accordingly, if the relative cost method is to be used for any purpose in this proceeding, the Commission should adopt and apply to Tidewater the relative cost factors for "dry gas" and "pure oil" which were obtained from the record in the *Omnibus* proceeding.[9] Tidewater contends that these relative cost factors, based on the composite experience of 17 major oil and gas producers, are more appropriate than the relative cost factors developed by intervenor witness Kahn on the basis of Tidewater's own experience. Accordingly, in Appendix 3 of its initial

[8] See testimony of intervenor witness Botset, 10:1524–26. Similarly, see testimony of intervenor witness Kahn at 10:1666.

[9] *In the Matters of Champlin Oil and Refining Company et al.*, Docket Nos. G–9277, *et al.* The *Omnibus* relative cost factors were developed in Exh. 50–LC in that proceeding, which constituted part of a composite "industry" cost-of-service study.

brief, in constructing a cost-of-service "in accordance with procedures used by the Commission in the *Phillips* case", Tidewater uses the *Omnibus* relative cost factors throughout its entire relative cost allocation.[10]
The *Omnibus* relative cost factors thus used for Direct Lease Expense were $1.1225 for liquids and $0.02712 for gas—the liquids factor thus being 41.4 times as high as the gas factor. By contrast Intervenor witness Kahn used a relative cost factor for liquids of $1.572 and a relative cost factor for gas of $0.0261—so that his liquids factor was 60.22 times as high as the gas factor. (Exh. 180, Sched. 2)

For the relative cost allocation of Direct Net Investment, Tidewater used the *Omnibus* relative cost factor of $3.98046 for liquids and $0.29584 for gas—the liquids factor being 13.45 times as high as the gas factor. By contrast, Kahn used a relative cost factor of $5.196 for liquids and $0.2337 for gas. (Exhibit 180, Sched. 6)—his liquids factor thus being 22.23 times as high as his gas factor)[11]

It is of interest to note that the *Omnibus* relative cost factors thus used by Tidewater *for gas* are not very substantially different from the gas factors developed by Kahn in his Exhibit 180. The really major and significant differences between the Omnibus factors and Kahn's factors occur in connection with the relative cost factors *for liquids*.

It is important to recognize that a portion of this disparity between the *Omnibus* liquids factors and the factors derived by Kahn results from and reflects the fact that Kahn used a different type of liquids leg than was employed in the *Omnibus* relative cost study. The *Omnibus* study used a liquids sample composed of *all 100% oil leases* (*i.e.*, leases which produced no marketed gas). By contrast, for reasons which will be discussed at length in a later part of this decision, Kahn developed a liquids leg composed only of "crude only-pumping-nil gas/oil ratio" leases. In addition, the *Omnibus* relative cost study employed a liquids leg consisting of *all vintage* "pure oil" leases. By contrast, for reasons which will be explained in detail at a later point, Kahn's relative cost allocation of On-Lease Net Investment (Direct Net Investment) employed only *recent vintage* "pumping only" leases for the liquids leg.[12]

Since it is here concluded that there are valid reasons, on the merits, for adopting these particular Kahn techniques, it is clear that the use of the *Omnibus* relative cost factors, which were derived on the basis of quite different techniques, should be rejected in this proceeding.

Entirely apart from the above, however, it is concluded that the use of the *Omnibus* relative cost factors, as here proposed by Tidewater for the purpose of determining its just and reasonable rates in the instant proceeding, should be rejected outright as totally inconsistent with the strict conditions explicitly laid down by the Commission in the *Omnibus* proceeding, governing the limited use which was to be made thereafter of the producers' composite cost-of-service study. The use of such data in the manner here proposed by Tidewater would constitute a plain violation of the fundamental requirements of due process.

In order to understand the problem here presented, it is necessary to briefly summarize the background and history of the *Omnibus* proceeding. That pro-

[10] Since the *Omnibus* relative cost factors were available only for the year 1955, these same factors were used in Tidewater's Phillips-type cost study for both its test year 1955 (Appendix 3, Sched. 3) and its test year 1957 (Appendix 3, Sched. 2).

[11] Tidewater used the same relative cost factors for Indirect Net Investment and Indirect Lease Expenses which it applied for Direct Net Investment. Kahn, however, used a composite, conglomerate average ratio for his relative cost allocation of both Indirect Lease Expense and Indirect Net Investment.

[12] Kahn similarly applied this same technique for his gas leg in his relative cost allocation of On-Lease Net Investment.

ceeding was set up by the Commission in order to provide the parties with the opportunity to present

> generally applicable evidence relating to a theory or theories of rate fixing for sales of natural gas by independent producers, subject to the jurisdiction of the Commission, including evidence of a general economic or accounting nature, but excluding evidence applicable only to the cost of service or form and level of rates of any particular and individual Respondent.[13]

During the course of the *Omnibus* proceeding counsel for certain of the producers offered in evidence, as Exhibits 44–IC to 52–IC, what was described as a combined or composite industry cost-of-service study based on statistics supplied by some 17 independent producers. This particular 17-company producer group did not come into being as the result of any calculated attempt or design to select companies which would present a representative, composite average picture of the entire producer industry. Instead, it had its origin in the fact that some 18 independent producer companies had banded together and employed the auditing firm of Arthur Young & Company to prepare a composite cost-of-service study based upon their own operations. The Arthur Young firm submitted a questionnaire to all 18 of the companies, but received the requested data back from only 17. It then proceeded to prepare the composite cost-of-service study on the basis of the responses received from these 17 producers. (See *Omnibus* transcript, 31–LC: 3809–15; 32–LC: 4023–30).

When this composite cost-of-service study was offered in evidence in the *Omnibus* proceeding, Commission Staff Counsel and various intervenors objected on the ground that they would not be afforded an opportunity to cross-examine the individual producers whose responses had provided the basis for the composite study, and to check and test the underlying data. The Presiding Examiner in the *Omnibus* case thereupon excluded the composite cost study. However, the Commission by order issued January 9, 1959 reversed the Presiding Examiner and admitted the composite cost study "as statistical evidence". The Commission explained that this material was being received in the *Omnibus* proceeding merely for the limited purpose of serving as "statistical evidence in the nature of broad background material *and not for the purpose of establishing costs or rates for any single individual producer*" (p. 24, emphasis supplied); that the purpose was merely to bring before the Commission "materials of possible aid in assisting the Commission to arrive at a method or methods of testing independent producer rates"; that "*The evidence so received is not to be used to test the rates of any individual producers* but to aid the Commission in determining on general principles applicable to the rates of independent producers."; that "on this limited basis and for this general purpose, it is worthy of examination along with the other statistical and economic data already adduced" (p. 3 of Order; *emphasis supplied*). The Commission further suggested that when the individual producer rate cases should later come to hearing, the Presiding Examiner in each such hearing "can best judge the extent to which the parties can be relieved of the burden of cross-examination and detailed verification of this evidence. . . ." (p. 24)

Subsequent to the issuance of Commission order, the intervenors in the *Omnibus* proceeding (who now constitute the intervenors in the instant Tidewater proceeding) proceeded with the cross-examination of producer witness Porter who, as a member of the Arthur Young & Company auditing firm, had

[13] Order Reversing Ruling of Presiding Examiner Excluding Evidence, issued January 9, 1959 (21 FPC 22) (p. 24, footnote 1).

prepared the composite cost-of-service study. During the course of this interrogation, intervenor counsel requested that he be provided with: (a) the replies which had been submitted by the 17 companies in response to the Arthur Young questionnaire; (b) the lease data of the 17 companies, to be used in checking the responses made by them to the questionnaire. He stated that it was necessary for the intervenors to have this information in order to be in a position to conduct a meaningful cross-examination with respect to the composite cost-of-service study. Counsel for the producer group, *which included Tidewater Oil Company*, categorically refused to provide this information. (See *Omnibus* transcript, 32–LC: 4002-4003)

Intervenor counsel then made a statement on the record, which is quoted here because it effectively characterizes the dilemma with which the parties were thereby confronted in the *Omnibus* proceeding. He stated:

> As far as I am concerned, we are confronted here with the cost of service study presented by a very able witness who, on the witness stand, indicates in his opinion he has done a very wonderful job. And I am not in a position to say whether he has or has not. Because I don't know what went into the cost of service study. He has taken responses to questionnaires from 17 companies, which he indicates have been cleared by CPA's of accounting firms over which he had no direct control, and based upon that polyglot of information, he has prepared and set up one huge natural gas producing company. We don't have the individual companies, we don't have the individual figures for any particular company, not even by company name. All we have is a cost of service study set up in very fine folders, which we have got to take in perfect good faith, and which may be used against us down the road in any number of ways, and depending upon the Commission may be accepted or rejected in any number of ways, without any opportunity on our part to cross-examine it. (32 LC:4009-10).

Subsequently, on April 1, 1959 the *Omnibus* intervenors filed with the Commission a joint application for *subpoenas duces tecum* to produce the following evidentiary materials:

> 1. The responses made by each of the companies hereafter named to a questionnaire submitted by Arthur Young and Company for certain data, which data were in turn used by representatives of Arthur Young and Company in the preparation of exhibits 44–LC—52 LC inclusive, testified to herein by the witness, Stanley P. Porter.
>
> 2. Lease data either in the form of ledgers or lease-by-lease records based on ledgers or any other comparable data used by representatives of each of the named companies in preparation of the responses referred to in 1, above, together with all pertinent letters, memoranda, or other corporate papers necessary to a clear understanding of such lease records. (pages 1-2 of subpena application)

The joint application further stated:

> The data requested are essential to secure information as to whether the records of the responding producers had any relation whatever to each other. Absent reasonable consistency in the producer records, the study is obviously meaningless, and such consistency cannot be assumed because there is no uniform system of accounts for producers.
>
> * * * * * * *
>
> . . . we submit that the further data we request are absolutely essential to permit a determination by the Commission of the usefulness of the

> cost study. Without such data the cost study can have no meaning and will remain merely a collection of figures derived from unlike data furnished on varying bases by an infinitestimal sample of 17 producers out of some 5,000. Its usefulness or weight simply cannot be tested. (p. 4)
>
> * * * * * * *
>
> It would seem to be the Commission's intention that evidence presented herein subsequently be incorporated in the several separate proceedings without the need for repeating the presentation in each instance. It would follow, therefore, that these applicants face the possibility of being confronted at some future time with this very evidence (Exhibits 44 LC—52 LC) which they now seek to test by means of obtaining data referred to in 1. and 2. above. If they are denied access to such data now and if in some future proceeding this study is admitted into evidence without affording them an opportunity to test its validity, in such proceedings there can be no doubt that applicants will have thus been denied due process of law. (p. 4-5)

By order issued April 22, 1959, the Commission denied the intervenors' subpena application, referring to and quoting the conditions which it had laid down in its previous order of January 9, 1959, as to the limited use for which the composite cost study was there received.

We are now confronted, in the instant *Tidewater* proceeding, with the very situation which the *Omnibus* intervenors anticipated and feared—a situation in which Tidewater, which itself was a party to the *Omnibus* proceeding, now seeks in the instant case to make use of the *Omnibus* composite cost study in the very manner and for the very purpose which the Commission guaranteed, in its *Omnibus* rulings, would *not* thereafter be permitted—*i.e.*, as a basis for computing its own individual-company cost-of-service.

It is concluded that the use of the *Omnibus* relative cost factors for that purpose in the instant proceeding would constitute a shocking violation of good faith and due process, and the proposal is therefore categorically rejected.

In addition, however, it seems axiomatic to state that it is preferable in any event to allocate Tidewater's joint production expense and investment on the basis of an evaluation of *its own* particular experience and operations, and that it is accordingly desirable to construct the relative cost factors here on the basis of Tidewater's own actual experience.[14] As already noted, however, Tidewater justifies its use of the *Omnibus* factors on the ground that it has no substantial dry gas production of its own, and that its own experience accordingly provides no reliable basis for the development of a gas leg. Tidewater witness Joseph conceded that Tidewater's own experience does provide a reliable basis for development of a liquids leg, but concluded:

> since it is necessary to obtain the sample pure gas cost from some other source I thought it best to go to the other source for both the pure gas cost and the pure oil cost. (37:5772)

However, as will now be developed in detail, it is concluded here that the gas leg derived by intervenor witness Kahn on the basis of Tidewater's "preponderantly gas" leases does constitute a satisfactory technique for development of a relative cost gas factor based upon Tidewater's own experience. In fact, as already noted, this technique resulted in a relative cost factor which is not very substantially different from the *Omnibus* "dry gas"

[14] This, of course, was the technique followed by the Commission in the *Phillips* case.

factor used by Tidewater. Under the circumstances, the Tidewater assumption that its own experience "simply provides no reliable figure on which to base the relative cost method of allocation" (initial brief, p. 48) is not valid.

Intervenor's Gas Leg

In Kahn's original 1955 test year cost-of-service study (Exhibit 75) he used a gas leg composed of "gas-only" leases, accounting for slightly more than 1 percent of Tidewater's total gas production by volume. This resulted in a relative cost gas factor of $0.0394 per Mcf. Kahn recognized at the time that this provided a thin sample. He accordingly tested this figure against the results obtained by the use of other samples and other methods. As a result of these tests, he concluded that the factor of $0.0394 was a relatively high one to use for the hypothetical "single-purpose" cost of gas; and that "beyond 'single-purpose' lease operations." (10:1682) However, in the absence of information permitting him to develop a more representative picture of the doubt it tends to exaggerate the on-lease expenses of gas production on production costs of non-associated gas, Kahn adopted the figure of $0.0394 "with the warning that it is probably excessive." (10:1683)

Subsequently, however, in connection with his 1957 test year cost-of-service concluded that the "gas-only" category now represented an aggregate produc- study (Exh. 150) Kahn developed a new type of gas leg consisting of two groups of leases: (a) a category which he characterized as the "preponderantly gas" leases, being Tidewater's gas-condensate leases which produced in excess of 100 Mcf of gas per barrel of petroleum; plus (b) the gas-only leases which showed both production and expenses.[15] (45:6777) Kahn explained that this change in the character of his gas leg resulted from the fact that data subsequently provided for the record by Tidewater witness Joseph had made it clear that many of the leases which Kahn had previously regarded as "pure gas" leases, on the basis of information in the early Tidewater work papers, actually produced liquids and accordingly did not properly belong in the "gas-only" category.[16] On the basis of this corrected information, Kahn concluded that the "gas-only" category now represented an aggregate production of only approximately 546,000 Mcf, representing approximately 6/10 of one percent of the company's total gas production. (45:6775) He also concluded that this reduced "gas-only" sample was subject to further difficulties (a) because more than half of its production was from leases which listed no expenses at all; and (b) because almost ¾ of its total expenses were registered on a group of *non-producing* leases, which Tidewater had classified as "gas-only" simply on the basis of an analysis of their underlying reserves. (45:6775–76) Under all the circumstances Kahn concluded that the "gas-only" category had turned out to be "erratic and unrepresentative".

Kahn accordingly developed in Exh. 150 a new gas leg composed largely of "preponderantly gas" leases (being the gas-condensate leases with a gas-oil ratio in excess of 100 Mcf per barrel), whose production represented approximately 10 percent of the total gas sales of Tidewater's Southern and Central Divisions. He stated:

> This provided me with a very broad sample which is in itself desirable wherever possible. . . . (48:7027)

[15] These "preponderantly gas" leases produced 9,707,282 Mcf of gas in 1957, while the selected "gas-only" leases produced 244,166 Mcf. (Exh. 150, Sched. 4)

[16] Kahn found that Tidewater's "pure gas" lease category included a fairly large group of leases which actually produced liquids as well as gas, simply because they showed no sales of liquids. (47:6899–6900) He also found that Tidewater's "pure gas" category included leases where some liquid was produced, but where the liquids were extracted in plants owned by other companies and Tidewater accordingly did not record such liquid production on its own books and records. (45:6772; 47:6923; 48:7023).

And he concluded:

> I am convinced that the resulting figure of 2.59 cents per Mcf, derived from this much broader sample of gas-condensate leases, together with those in the gas-only category which show both production and expenses, is a highly reliable indicator of the on-lease cost of producing gas in the absence of oil (45:6777)

Kahn had called attention in his Exhibit 150 cost study to the fact that the "preponderantly gas" lease category there employed excluded

> a number of leases in District 16–3 with gas-liquids ratios above 100 Mcf per barrel, where the charge for depreciation and depletion is not distributed among the leases in the district. (Exh. 150, Shed. 4, Footnote 5) [17]

Although Kahn recognized that these particular District 16–3 leases met the standards which he had established for his "preponderantly gas" category, he originally did not find it possible to include them because he had been unable to obtain the depreciation and depletion charges properly assignable to those leases from the Tidewater books and records. Subsequently, during the latter stages of the hearing Tidewater made available certain information showing how the depreciation and depletion charges should be distributed to these District 16–3 leases. (49: 7074–75) As a result of this new information, Kahn thereupon added the District 16–3 leases to his "preponderantly gas" category in his final 1957 test year cost study, Exhibit 180.[18] The effect of this change was to double the size of the gas leg, with the result that the "preponderantly gas" category finally accounted for no less than 22 percent of the total production of the Southern and Central Divisions. (53:7485) The end result was to increase Kahn's gas factor from 2.59 cents per Mcf to 2.61 cents per Mcf, and to increase the ultimate on-lease expense allocated to gas from 1.14 cents per Mcf to 1.42 cents per Mcf.

Tidewater critizes Kahn's use of a gas leg composed largely of the gas-condensate leases with a gas-oil ratio in excess of 100 Mcf per barrel (the "preponderantly gas" lease category), contending that joint product leases should not be used to determine the relative cost factors allegedly representing the cost of producing *one* of the joint products in the absence of the other. In this connection, Tidewater emphasizes the fact that the Commission in its *Phillips* decision used only dry-gas leases for this purpose.

In addition, Tidewater attacks Kahn's adoption of "a gas-oil ratio in excess of 100 Mcf per barrel" as his standard for the "preponderantly gas" lease category, characterizing this as merely a "subjective grouping of certain joint production leases", and as

> an arrangement which first determines the answer and then dips into a huge volume of detail in the record for the selection of those leases which

[17] The District 16–3 leases were in the Hollywood Field, Terrebonne Parish, Louisiana.

[18] The Tidewater statement (initial brief, p. 49) that this occurred after Kahn was "*confronted* with the fact that the sample set of 'perponderantly gas' leases used in their initial 1957 cost of service presentation (Exhibit 150) did not contain certain important leases in the Hollywood Field, though such leases met the definition and standards which the Intervenors themselves had established"—contains a completely unwarranted inference. This point was first raised by Tidewater counsel during his cross-examination of Kahn at an April 20, 1960 hearing session. (48:7037) However, as noted above, it was Kahn himself who had directed the attention of the parties, *six months earlier*, to the fact that his Exh. 150 did not include the District 16–3 leases—Exh. 150, Sched. 4, footnote 5. (49:7074) Under the circumstances, the April, 1960 interrogation by Tidewater counsel hardly constituted a "confrontation".

> will provide the desired allocation ratios and lend some color of rational support for an answer which is inescapably arbitrary. (initial brief, pp. 48-49)

Tidewater states:

> Obviously there is no way to tell whether leases producing 100 Mcf, or more, of gas per barrel of liquids provide a more representative cost of gas alone than leases producing 98, 99, etc., Mcf per barrel of liquids.

It is concluded that there is no valid basis for this Tidewater charge that the standard referred to above represented an arbitrary and subjective selection of leases merely designed to support a pre-determined answer. Instead, bearing in mind the practical problem presented in this proceeding that Tidewater itself has no substantial dry gas production, the standard thus employed for the "preponderantly gas" lease category seems reasonable and makes sense in view of the following facts as noted by Kahn:

(1) that 90% of the revenues from such "preponderantly gas" leases were obtained from gas;

(2) that the State of Texas classifies wells as gas-wells if they produce in excess of 100 Mcf per barrel of petroleum;

(3) that it has been the practice of the Federal Power Commission staff in general:

> to consider as essentially gas, essentially dry gas leases, those in which liquid accounted for ten percent or less of revenue. And that accorded fairly closely with the State of Texas designation. (48:7025)

It should also be noted that in spite of its attack along the lines referred to above, Tidewater does not here suggest that the gas-condensate leases employed in Kahn's "preponderantly gas" lease category constituted unrepresentatively low-cost leases.[19]

Finally, it is of the utmost importance to note here that in employing these particular gas-condensate leases as his "preponderantly gas" lease category for the development of his gas cost factor, Kahn treated the *entire* on-lease cost of these gas-condensate leases as the *gas* cost, and did not charge or assign any portion of such costs *to the liquids* which were produced by these leases. Kahn stated:

> I think that it is clear that to the extent that these are not pure, 100% gas leases, that one may contend that the imputation factor derived from them is high in the sense that so far as the leg is concerned there is no attribution of any costs to liquids. I would say that was the primary defect.
>
> But I regarded the offsetting advantage of getting such a large leg in so widely representative a sample, whose size, incidentally, increases enormously now that we can put the Hollywood Field leases in, as far outweighing this particular disadvantage. (52:7403)

It is difficult to see how Tidewater under these circumstances can be heard to complain that Kahn's use of his "preponderantly gas" lease sample was arbitrary or unfair.

It may be recognized, as stressed by Tidewater, that the gas leg as thus developed by Kahn in this proceeding was somewhat different from the type of gas leg employed by the Commission in its relative cost allocation in the

[19] No such suggestion could seriously be made since the producers themselves have uniformly stressed before this Commission that the gas-condensate leases represent relatively high-cost production.

Phillips case. However, it should also be recognized that variations in operating factors or conditions between one producer and another may conceivably render it desirable or necessary in some cases to apply the relative cost method in a manner which represents some modification or adjustment of the precise method employed in the *Phillips* case. Such a departure under such conditions should not, however, be regarded as objectionable *per se*. The Tidewater insistence that this Kahn departure from the precise application of the relative cost method employed in the Phillips case constitutes a fatal defect in the instant proceeding represents an inflexible and rigid approach which is neither useful, necessary, nor desirable in dealing with problems of this character.

Intervenors' Gas Volume Adjustment

The gas volume figures used by Tidewater represent marketed (or net) production. Before applying his relative cost method to allocate on-lease expense and on-lease investment, intervenor witness Kahn adjusted the 1955 marketed gas volumes upward by 24.6 percent (Exh. 75–B, Sched. 6) and the 1957 marketed gas volumes by 20.85 percent (Exh. 150, Sched. 5, and Exh. 180, Sched. 6), in order to determine and reflect the volumes of gas actually produced at the wellhead—*i.e., gross* wellhead production.

In explaining the basis for this volume adjustment, intervenors noted (initial brief, pp. 22-23) that the gross production of gas on joint-product leases is typically far in excess of the net production by virtue of returns of gas to the reservoir, venting, and flaring. The intervenors contend that the cost of producing that portion of the gas on the joint leases which is either vented, flared, or returned to the reservoir is clearly attributable to the liquids and should be charged thereto; that it is accordingly necessary to adjust the marketed production figures presented by Tidewater upwards in order to obtain an estimate of the cost of producing the gross production of gas, and then to attribute the cost of producing the difference between gross and net production to the liquids.

Intervenor witness Kahn testified, in this connection:

> Any expenses appropriately allocable to the production of gas on joint leases is clearly incurred in the gross production of that gas, regardless of what proportion thereof is flared or vented, or returned to the reservoir. Expenses incurred in the production of gas that is not sold as such are correctly attributed not to the gas but to the production of the liquids, which are essentially responsible for these practices that create a discrepancy between total and marketed production. (31:4719)

With respect to gas vented or flared, he explained:

> Since the so-called net production is really marketed production, there would also be wasting of gas. That is, it comes up, it is not put back into the ground, but it is burned, or it is flared in some way. Now, that venting and wasting, it is my understanding, occurs primarily on oil wells. There is no reason to vent or flare gas that is in gas-only wells. But if you are producing oil and you are dying to sell the oil, and the oil is valuable, and you cannot find a market for the gas, then to the extent the states let us, you may let the gas go to waste.
>
> Well, the question then is should the cost of producing that gas that is wasted in order to recover the oil be imposed on the people who buy some of the other gas that you sell? So those would be the two main adjustments. (Tr. 4097)

In further support of this volume adjustment, the intervenors explained (initial brief, pp. 23-24) that this particular correction represented only partial recognition of the fact that on the joint-product leases it is the gas that plays the important role in lifting the liquids, rather than the reverse; that accordingly, instead of simply dividing the economies of joint production equally between the products in proportion to their single-production cost, it was felt desirable to give some additional recognition to the contribution of gas to the liquids; that, lacking any other method for giving this recognition, the use of gross rather than net gas production, in the manner described above, was accepted as giving partial credit to gas for its facilitating role in the production process. Intervenor witness Kahn made this point as follows:

> I thought it appropriate to modify the precisely proportionate reduction in expenses imposed on both products, because I was seeking some method of giving gas credit for lifting the liquids, and that method was the one we have described of imputing the single purpose product cost to the gross or estimated gross production of gas. And then on the basis of the fact that the difference between gross and net production of gas, and the costs justly attributable to that difference, are appropriate attributable to raising the liquids, imposing on gas only a total burden equivalent to what would be appropriate to the marketed production of gas. (50:7116)

And at another point he stated:

> The relative cost method without adjustment divides the economies of joint operation of wells precisely—proportionately among the gas and the liquids that the gas helps raise.
>
> And in my very beginning testimony I said that this raised a question about whether there was not some adjustment, rough or otherwise, that could be made to reflect the fact that this distribution contains within it the implicit assumption that the liquids helped raise the gas, just as much as the gas helped raise the liquids, an assumption contrary to fact. Indeed, the fact is the very opposite, that the necessity for lifting the liquids in a sense makes more difficult the recovery of the gas.
>
> I then said in my redirect that one approximation or one attempt to give gas this measure of credit was to use the particular correction that I have described with the logic that it contained that this was merely one rough way and an inadequate way of giving gas—shall we say, recognizing the physical situation that I have described. (50:7165-7166)

Although Tidewater does not raise any question with respect to this particular rationale in its discussion of the instant gas volume adjustment, at a later point in its initial brief (p. 50) in connection with its attack upon the "liquid leg" employed under Kahn's relative cost method, Tidewater raises a doubt as to the propriety of crediting gas for its role in lifting the liquids. In this connection, it contends that the Commission in its *Phillips* decision recognized that the alleged benefit of gas in the lifting of liquids is speculative and not susceptible to measurement, quoting the following Commission language:

> The record does not finally resolve this question nor does it provide a way of computing the credit for any supposed lifting effect of the gas.
>
> In fact, we think that it would be almost impossible to compute the value of the lifting effect of gas in oil production. Furthermore, it can be said that the lifting effect of gas is not so much a reason to give a credit to gas, but reason to increase the value of gas, for lifting oil is a very valuable use for gas. (Op. 338, p. 555)

The meaning and purpose of the last sentence in the above-quoted statement from the *Phillips* decision is obscure and could not properly be regarded as a Commission finding on this point. The lifting function performed by gas for the benefit of the liquids in a joint product reservoir does, of course, represent "a very valuable use" of such gas for the benefit of the producer. However, this "valuable use" obviously does not increase the value of the gas *to the gas consumer*, and should not be treated as a justification for increasing the price paid by the latter. Rather, it represents a service of value *to the purchaser of the liquids*, and it would therefore seem appropriate that the liquids should be charged with some portion of the gas cost in return for this contribution. The Commission in its *Phillips* decision correctly concluded that there was no basis *in that proceeding* for determining a credit to be applied to gas for this lifting function, in view of the fact that the record there made admittedly did not provide any adequate basis for computing any such credit. (Op. 338, p. 555) The situation is quite different in the instant Tidewater proceeding, where the intervenors (through their witness Kahn) have developed, presented and supported the gas volume adjustment discussed above as a method for providing a partial credit to gas in return for this lifting function. The important thing to bear in mind is that the Commission is here dealing with a field in which there are still many lessons yet to be learned. It would be neither useful nor necessary in the public interest, to take the position here that the problem must be regarded as forever insoluble merely because no adequate solution was presented in the *Phillips* case.

In determining that a gas volume adjustment of 24 percent was required for 1955 and 20.85 percent for 1957, in order to convert Tidewater's marked production figures to gross gas production, Kahn relied upon information supplied by Tidewater to the effect that their experience in this connection would closely approximate that of the country as a whole. He accordingly obtained his gas volume adjustment ratio from the bureau of Mines nationwide figures.[20]

Kahn explained:

> The Tidewater Company representatives had agreed to try to obtain for me information showing the Company's gross, net, and marketed production of natural gas, in a form corresponding to the statistics compiled by the Bureau of Mines. In a letter of June 26, 1958, from Mr. Robert O. Koch to Mr. William R. Duff, the Tidewater Company notified us that it would require an extended effort to compile this information, and offered the opinion 'that the percentage of the volume of gas that is nationally used for the above purposes will approximate the same percentage of Tidewater's volume of gas that is so used.' Accordingly, I applied the national figures for 1955, which shows a gross natural gas production 24.6 per cent higher than marketed production, to Tidewater. (31:4719–20)

The mechanical steps of Kahn's volume adjustment were carried out as follows. He first increased Tidewater's marketed production figure for gas by the above-mentioned ratio, to produce an estimated gross production of gas on the joint leases. He then completed all the steps of the relative cost method on that basis, to determine the on-lease expense allocated to the gross production of gas. This total was divided by the estimated gross production of gas,

[20] The 1957 adjustment figure of 20.85 percent was derived from information on page 312 of "1958 Minerals Yearbook, Vol. II, Fuels", where it appears that the quantity of repressured, vented, and wasted gas equalled 20.85 percent of gas marketed and consumed by producers in 1957.

to determine the unit cost of producing all the gas that was actually produced. In the final step, this unit cost figure was multiplied by the net (or marketed production of gas), in order to arrive at the cost to be charged to the marketed gas. The remainder of the gas cost (*i.e.*, the cost of the non-sold gas) was charged to liquids. (31: 4720–21; 27:4093–94)

As pointed out by Staff (initial brief, p. 13), this gas volume adjustment follows the Commission approach in *Phillips*, where the cost of extraction losses, gas returned to leases, and gas vented, was allocated out of the jurisdictional gas cost-of-service. (Op. 338, p. 564, Appendix 9 and 10); as further clarified in Commission Order Denying Rehearing, November 25, 1960, at p. 1010 and in Appendix 9, Revised) Under the *Phillips* technique the cost-of-service for jurisdictional gas was not charged with that portion of the total cost of the wet gas stream which was determined to be allocable to the gas returned to leases for repressuring and to the gas vented or flared.

Tidewater states (initial brief, p. 37) that it "does not object to this adjustment of test year sales volumes for the purpose of estimating wellhead raw gas volumes . . .". In fact, it states at a later point (initial brief, p. 94):

> Since Tidewater records show recorded gas *sales* volumes instead of gross *production* volumes, it was necessary to estimate the volumes of wet gas actually produced at the wellhead.

However, Tidewater strenuously argues that if such an adjustment is to be made, it requires a corresponding reduction in the wellhead liquid production volumes; that Kahn's failure to make such a corresponding reduction of liquid production volumes has the effect of imposing a double, or duplicate charge for the cost of the liquids—*i.e.*, both (1) at the point where they are produced in a gaseous phase at the wellhead, and (2) at the point where they are extracted in the gas processing plants. (initial brief, pp. 38-39)

It is important to recognize at the outset that this Tidewater position stands or falls upon the suggestion or assumption, made and pursued at length by its counsel during an extended interrogation of intervenor witness Kahn, that the Bureau of Mines national figures for (a) repressured gas (gas returned to reservoir) and (b) vented or flared gas, representing the difference between gross and net (or marketed) production, *also included shrinkage* (*i.e.*, the effect of the plant extraction of liquids from the wet gas stream upon the volume of gas reamining). The entire point made by Tidewater here is that if the figures for repressured and vented gas, which were used by Kahn to obtain his gas volume adjustment factor, also included shrinkage, then the effect of his volume adjustment would be to charge crude oil and condensate with the cost of such extracted liquids. Tidewater points out that plant liquids are *already* included in its recorded total liquid production,[21] which under the relative cost method shares an allocated portion of the joint product lease costs; that accordingly, unless a corresponding amount of plant liquids are removed from the total liquids production volume, the net effect would be to impose a double or duplicate charge on the plant liquids.

As will now be made clear, however, it appears that the Bureau of Mines figures for repressured and vented gas (employed by Kahn in this connection) do *not* include shrinkage—and this would appear to destroy the entire basis for this Tidewater position.

As already noted, intervenor witness Kahn at an early stage of the proceeding had requested Tidewater to provide him with the figures as to its own *gross* gas production—this information being peculiarly and solely within Tidewater's own possession. Tidewater nevertheless informed the intervenors

[21] Tidewater Exh. 129, Sched. 5; Appendix 3 to Tidewater initial brief, Sched. 2, p. 6.

that the compilation of such information would require an extended effort on its part, and suggested (as an acceptable alternative) that the nationwide ratio of gross production to net production would be approximately the same as its own experienced ratio. It was in reliance upon this Tidewater suggestion that Kahn thereafter obtained and relied upon the Bureau of Mines nationwide figures as a basis for the instant gas volume adjustment.

In spite of the facts as outlined above, Tidewater counsel in the course of his cross-examination of Kahn during the latter stages of the hearing devoted a great deal of effort to suggesting that the Bureau of Mines nationwide figures for (a) repressured gas and (b) vented or flared gas *included shrinkage*, and proceeded to attack Kahn's gas volume adjustment on the assumption that this was the fact. (50:7138–56) Kahn at this point readily agreed that if the Bureau of Mines data actually did include shrinkage, it would then be appropriate to make a corresponding reduction in the recorded liquid production volumes in order to avoid a duplicate charge to liquids, and he suggested:

> . . . there is really nothing to do but look to the Bureau of Mines and see if it does. (50:7156)

Tidewater counsel thereupon made it perfectly clear that his whole argument hinged upon whether the Bureau of Mines data in fact included shrinkage, stating:

> Q. So, really, I think we can agree, Doctor Kahn, that the determinative question is whether or not the 24.6 per cent includes shrinkage or not?
> A. I believe that is right. (50:7157)

Because of the unsatisfactory situation created on the record as the result of the uncertainty thus raised by Tidewater counsel, who himself showed no disposition to resolve the doubt by any evidence of his own, the Presiding Examiner suggested at the hearing session on April 22, 1960, that the parties contact the Bureau of Mines during an extended noon recess and obtain the precise answer—one way or the other. Later that day, at the afternoon session, Tidewater counsel simply reported that his own efforts had been unsuccessful and dropped the matter. (50:7169)

Doctor Kahn, however, testified as follows as to the results of the inquiry which he had made at the Bureau of Mines during the noon recess:

> I got in touch with Mr. Ivan Avery, who is chief of the section on natural gas, natural gasoline and carbon black of the petroleum economics branch of the Bureau of Mines. I was referred to him by two different people as being the expert on the contents of the statistics in question.
> Mr. Avery tells me that there is no adjustment for shrinkage in the difference between gross and marketed production, and that there could not be, because of the way in which these figures are compiled.
> The figures that this estimating process begins with are the figures for marketed production. These figures he tells me are very firm, they are figures that come from the companies. The Bureau then builds up to the estimate of gross production, first by adding the estimated volumes used for repressuring. And these figures too, he tells me, are very firm, that is, they are very confident of their validity, they are based, he said, primarily on information from the companies, and he said there was no possibility that those figures could contain an element of shrinkage or the reverse of shrinkage if you build it back up.
> And then secondly, they make an estimate of losses by venting and flaring. This figure, he said, is not as reliable a figure, but again there is no

reason for that figure to include an allowance for the opposite of shrinkage—you understand, it is the opposite, because we are building back up now.

So I put the question in another way, I said, is there any reason, then, to believe that the market production figure would be shrunk down? And he said specifically the marketed figure would not be shrunken down in any way.

I then asked, 'Would there be wet gas, then, in your marketed production?' And he said, 'Yes, there would be wet gas in the marketed production figure.' He was not explicit about how much he thought was wet and how much dry, but the significant point that he emphasized was that the estimates of the figures that it would take to go backwards from marketed up to gross are estimates of what they purport to be, directly made by the Bureau, and would not therefore be subject to the defect from our standpoint that we discussed before lunch.

PRESIDING EXAMINER: Dr. Kahn, in order to fit your answer into the context of the type of questions which Mr. Atwell was asking before the noon recess, would I be correct in saying that the effect of what you are saying is that if we accept at face value what Mr. Avery of the Bureau of Mines told you, that this indicates to you that the category of gas vented and wasted in the Bureau of Mines source material does not include shrinkage? (50:7170–72)

* * * * * * *

A. That is right. It does not include any factor for shrinkage—it does not include shrinkage. (50:7170–72)

* * * * * * *

BY MR. ATTWELL

Q. Now, did you explain to Mr. Avery what use you were making of the Bureau of Mines figures?

A. Absolutely not.

I began the conversation by saying that a question had been raised about the mining of the gross and the marketed production figures, and specifically the question was whether the difference between them was in any way explicable by shrinkage, and he proceeded then to explain along the lines that I have indicated. (TR 7173–74)

In spite of this testimony, Tidewater counsel expressed continued dissatisfaction with the situation, suggesting that it was his "understanding" that when Tidewater itself reports such figures to the Bureau of Mines, those figures do include shrinkage; that other companies probably make their reports to the Bureau of Mines in the same way. He further suggested that Kahn might have misunderstood what he was told by the Bureau of Mines, or that error may have occurred in some other way. The following colloquy then occurred:

MR. ATTWELL: Mr. Examiner, I think before I give you a direct answer to your question, I might state that Mr. Avery is a pretty busy man. We had a rather long session with Mr. Avery, and I don't know whether I ought to put myself on the stand or Mr. Koch or Mr. Joseph. You know sometimes you talk to these people and Dr. Kahn gets one impression and we get another.

I am not saying that he is not absolutely correct in his impression, I am not saying that he is not entitled to it.

PRESIDING EXAMINER: Suppose, for example, you would want to produce evidence to show that the official in the Bureau of Mines said

something to you about the subject which is inconsistent with the information Dr. Kahn got from him; is that what you are suggesting?

MR. ATTWELL: I wouldn't say it was directly inconsistent. To summarize it, what he told us, in my opinion, was that he flatly didn't know and couldn't tell.

PRESIDING EXAMINER: That was interesting, but unless I knew what kind of questions you put to him, I wouldn't have any way of evaluating whether the answers were meaningful. Perhaps you didn't do as good a job of putting questions to Mr. Avery as Dr. Kahn did.

MR. ATTWELL: Perhaps we did a better job, Mr. Examiner.

I don't think we know what questions Dr. Kahn exactly put to Mr. Avery.

THE WITNESS: I am under oath.

MR. ATTWELL: I will be happy to take the witness stand if the Examiner wants me to do so.

PRESIDING EXAMINER: The way I am going to leave it, Mr. Attwell, is that you can make any argument you care to in your briefs as to the 24.6 percent adjustment, and that argument will have to be based on data in this record. If the data in this record is not as satisfactory as you would like it to be, my feeling is that Tidewater is the one party in this whole proceeding that could have made the data more satisfactory, and Tidewater didn't do it—I am not criticizing Tidewater for not making a lengthy study, but you didn't make it, and that is it as far as I am concerned.

MR. ATTWELL: I might say one thing in reply to that, Mr. Examiner. Tidewater didn't say, in response to Dr. Kahn, the difference between our gross marketed production and net marketed production is precisely the same thing as the Bureau of Mines reports, they simply said that it would probably approximate that same percentage.

Now, Tidewater didn't investigate at that time as to what exact elements composed the Bureau of Mines data.

PRESIDING EXAMINER: Mr. Attwell, at that stage of the proceeding, which was long before you came into the picture, we had reached a point where I insisted that the intervenors make clear to Tidewater all the further data the intervenors would need for this proceeding, and the intervenors did so, and one of the types of data requested was the type we are discussing now. And it was in response to that that Tidewater then, through Mr. Koch, wrote a letter to the intervenors suggesting that instead of Tidewater making that study, that the information could be obtained from the national figures.

I just feel there is nothing more to be added to that, whatever argument you want to make on the point will have to be made in your brief.

BY MR. ATTWELL:

Q. Let me ask one concluding question on that subject, Dr. Kahn—maybe two questions.

Just to be sure I understand your testimony to the Examiner relative to your—I believe the telephone conversation, wasn't it, with Mr. Avery?

A. That is right.

Q. Is it the purport of your testimony that the Bureau of Mines figures that you relied on to make your volume adjustments just do not include shrinkage in any of the items which we were talking about this morning?

A. That is right. This is merely another way of saying that the Bureau of Mines figures in fact are what they purport to be, which I assumed they were at the outset. (50:7177–80)

Under the circumstances as outlined above, it is here concluded that it would be completely unjustifiable to give any serious weight to the doubt self-generated by Tidewater with respect to the meaning of the Bureau of Mines figures—when all doubts could readily have been dispelled if Tidewater had seen fit to provide its own figures.

Since it is thus here concluded that the Bureau of Mines figures for repressured and vented gas, which were added to marketed production to obtain the gross production level, do not include shrinkage, it is clear that Kahn's estimated gross gas production volumes, derived by application of the Bureau of Mines nationwide ratio, do *not* include liquids. There is accordingly no merit in the Tidewater contention that the failure to make a corresponding reduction here in its recorded liquid volumes "has the effect of including liquids in both gross gas production volumes and liquid production volumes" (initial brief, p. 39), and that the result is "to duplicate the costs allocated to liquids". (initial brief, p. 37) On the contrary, the effect of Kahn's gas volume adjustment is merely to charge liquids with (a) the cost of the gas which is used for repressuring, and (b) the cost of the gas which is vented or flared—costs which should properly be charged to the liquids since this particular disposition of gas is dictated by operating considerations relating to the liquids. It was for this very reason that the same costs of gas returned to leases, and gas vented, were allocated out of the jurisdictional gas cost-of-service in the Commission's *Phillips* decision, *supra*.

Tidewater suggests as another claimed error in Kahn's application of his gas volume adjustment, that the Bureau of Mines figures for repressuring, which were the basis for his 24.6 percent factor, included *some* gas returned to reservoir on "liquids only" leases; that it was improper to include repressured gas from such leases in the Bureau of Mines figures, since Kahn's cost-of-service charged *all* production costs of the "liquids only" leases to the liquids alone. (initial brief, pp. 40-41)

Kahn characterized this as a *de minimis* situation, noting that the ultimate production of Tidewater's "liquids only" leases was

> only about three hundred thousand barrels, whereas the aggregate condensate production of the Southern and Central Divisions is about 3.9 million barrels, or approximately twelve times as much, and to all of this, as well as to the fifteen million barrels of crude oil produced in the presence of gas, gas also makes its contribution. (50:7181)

He concluded:

> liquids only leases accounted for only a very small proportion of Tidewater's total liquids production.
> So that the extent to which this is a double dip is undetermined but, I judge from those figures, small. (52:7399)

Kahn further noted that his proposed gas volume adjustment only partially compensated for the lifting service performed by gas in any event, and he accordingly felt that there was room for some slack here. (50:7165–67) Under the circumstances it is concluded that this point does not merit further consideration.

Intervenors' Liquid Leg

In Kahn's latest 1955 cost study (Exh. 75–B), and in his 1957 cost studies (Exhs. 150 and 180) he employed for his relative cost allocation of on-lease expenses a "liquid leg" consisting of the "crude only-pumping-nil gas/oil ratio" leases. These were crude only leases which had all wells on the pump, and with a negligible or nil production of gas per barrel of oil.

Tidewater charges that:

> Throughout this proceeding, as their various cost of service studies were presented, the methods, principles and costing techniques were constantly changed to coincide with the subjective ideas of the Intervenors' cost of service witness. The most flagrant example of the Intervenors' vacillation was their use of continually changing samples in order to establish relative cost factors for the allocation of production expenses and investment. (initial brief, p. 21)

Tidewater cites as an example of intervenors' alleged vacillation the fact that in Kahn's earliest 1955 cost studies (Exhs. 75 and 75–A) he had employed a liquids leg consisting of "*all* crude oil only" leases; whereas in his latest 1955 cost study (Exh. 75–B) and in his 1957 studies (Exhs. 150 and 180) he had switched to a liquid leg consisting of only the "crude only-pumping-nil gas/oil ratio" leases. In this connection, Tidewater refers to Kahn's Exhibit 75–B relative cost allocation as

> . . . utilizing imputing factors which were, *after an earlier abortive attempt*, obtained from leases classified as gas only and crude only-pumping-nil gas/oil ratio. (initial brief, p. 22; emphasis supplied)

The facts are as follows. Although Kahn used "all crude oil only" leases as his liquid leg in his original Exhibit 75, he there explained:

> In the hope of obtaining a more reliable estimate of the cost of producing crude oil *in the absence of gas*, we requested Tidewater to furnish us on-lease expense data for those crude oil-only leases representing oil wells actually and entirely on the pump, as a separate group and for those producing though not selling any gas, as a distinct group. *However, our request for such a breakdown was not successful.* (10:1668–69; July 29, 1957; emphasis supplied)

At a later hearing session on April 10, 1958, Tidewater counsel, in the course of his cross-examination of Doctor Kahn, presented and identified (for use in connection with his interrogation) an Exh. 116. This exhibit, among other things, provided the information which had previously been requested by Kahn, showing the breakdown of the "all crude oil only" leases into those entirely on the pump. (25:3868) At a subsequent session Kahn presented his Exh. 75–B, constituting a revised 1955 cost study. He then explained, among other things, that as a result of the breakdown provided in Tidewater's Exh. 116, he had been enabled for the first time in his Exh. 75–B to develop a liquid leg composed only of the "crude only-pumping-nil gas/oil ratio" leases. (31:4713) He explained:

> You will recall that the purpose of this analysis of on-lease expenses in the crude-oil only category was to obtain an indication, from the Company's own experience, of the cost of producing oil in the comparative absence of gas. As I indicated on pp. 1667 to 1668 of my original testimony, the crude oil-only expense data I originally used provided an only imperfect measure, because they embraced a mixture of leases producing a wide variation of quantities of gas per barrel of oil. The breakdown supplied me by the Tidewater Company, showing gas: oil ratios lease-by-lease, permit a much closer approximation to what I was seeking. (31:4716–17)

He subsequently emloyed the same technique in his 1957 cost studies. (45:6773)

The record thus plainly establishes that Kahn, from the very beginning, desired and sought to obtain a breakdown of the "crude oil only" leases, which

would enable him to develop a liquid leg composed only of those crude oil leases which were entirely on the pump; and that his use of "all crude oil only" leases in his cost studies prior to Exhibit 75–B resulted solely from the fact that the intervenors' earlier requests to Tidewater for the necessary data permitting this breakdown had proved unsuccessful. Under these circumstances, it hardly seems appropriate for Tidewater to now cite this change in Kahn's liquid leg as a "flagrant example of the Intervenors' vacillation", or to characterize Kahn's earliest liquid leg as "an earlier abortive attempt."

In making an evaluation on the merits of Kahn's "crude only-pumping-nil gas/oil ratio" sample, it is important to bear in mind that

> the basic rationale of the relative cost method is to divide the joint costs of multiple purpose investment in proportion to the costs of providing the several *single* services. (31:4735; emphasis supplied)

It seem axiomatic that in developing the relative cost factor to be employed for liquids, our object should be to construct a liquid sample which, as closely as possible, will measure the cost of producing liquids in the near or complete absence of gas, so that such factor will be unaffected and uncomplicated by any lifting contribution made by gas. The "crude only-pumping-nil gas/oil ratio" sample employed here by Kahn seems clearly more suited to this objective than the "all crude only leases" sample, in view of the fact that although leases in this broad latter category show no gas *sales*, many of them nevertheless had gas *production* which *did* perform a lifting function for the liquids.

Tidewater states that the Commission in its *Phillips* decision characterized the alleged benefit of gas in the lifting of liquids as "speculative", and concludes:

> . . . it is little wonder that in *Phillips*, the Commission used *all* of the leases in the '100 percent oil' category and did not attempt to restrict its lease sample to wells on the pump and/or those which had 'nil gas/oil ratios'. (reply brief, p. 7; initial brief, p. 50)

However, this does not accurately reflect the Commission's holding in *Phillips*. It is true that the Commission there stated:

> In fact, we think that it would be almost impossible to *compute* the value of the lifting effect of gas in oil production." (Op. 338, p. 555; emphasis supplied)

As earlier noted in the instant decision, this conclusion was arrived at by the Commission in the face of the record made in that proceeding, which admittedly provided no adequate basis for computing the credit to be applied to gas for the lifting function. However, the Commission did not in its *Phillips* decision find that the benefit conferred by gas in the lifting of liquids was dubious or speculative. Instead, the Commission there stated:

> Testimony in the record showed that gas enables the recovery of a greater amount of oil from a pool than would otherwise be possible. It does this by reducing surface tension, viscosity, and specific gravity and by providing a source of energy which moves the oil through the formation to the well bore and thence to the surface of the ground. (Op. 338, p. 555)

It was because of the very difficulties encountered in the *Phillips* case in measuring and computing the precise credit which should be assigned to gas for its lifting function, that intervenor witness Kahn in the instant Tidewater proceeding developed his "crude only-pumping-nil gas/oil ratio" sample—so that this particular problem or complication would not be involved. This appears to be a practical and useful way to deal with this troublesome problem.

No such proposal or suggestion was advanced in the *Phillips* proceeding, and it therefore was not possible to work out a useful solution in that case. That historical fact, however, should not now be treated as a basis for foreclosing the Commission from further studying this matter and evolving improvements thereon.

It is accordingly concluded that the Kahn liquid sample should be evaluated here on its merits, and on that basis it is found suitable, and appropriate for use in the instant proceeding.

In the course of its attack on the liquid leg as here developed by Kahn, Tidewater notes (initial brief, p. 50) that although the "all crude only leases" category accounted for 19.77% of its total 1957 liquid production (Exh. 150, Sched. 1), the "crude only-pumping-nil gas/oil ratio" sample employed by Kahn accounted for less than 1% of its total 1957 liquid production (Exh. 150, Sched. 1 and 3). Kahn himself pointed out, in the course of his direct testimony with respect to his Exh. 75–B, that the "crude only-pumping-nil gas/oil ratio" category in 1955 comprised only 20 leases, producing 468,000 barrels of oil and $1,419,000 of revenue, representing only from 2.4% to 2.6% of the total crude oil production of the Southern and Central Divisions. (31:4717) Using this sample in Exh. 75–B he derived a "total on-lease expense" figure of $1.542, as his cost of producing crude oil in the absence of gas—this being the liquids cost factor which he then imputed to the liquids on the joint product leases. When asked whether he regarded the number of these leases and the total of their production as sufficient to provide a reliable leg for this purpose, Kahn stated:

> It would of course be preferable to have a larger sample. . . . More important, both logic and the figures themselves strongly support the reasonableness of the $1.542 figure. As my testimony indicated, one would expect oil produced in the complete absence of gas to involve higher on-lease expenses than oil produced with gas, and that is what the figures indicate. On-lease expenses of all pumping wells, excluding the cost of developmental dry holes, were $1.205, in contrast with the comparable figure of $1.542 for pumping wells with no gas. Again, one would expect the unit expense of pumping wells, which, according to the Tidewater information, produced on the average about 400 cubic feet of gas for every barrel of oil, to exceed those of wells not on the pump, which had a 2,400 average gas/oil ratio. And, in fact, oil cost only $0.90 a barrel on the latter leases, again excluding developmental dry holes, which are really in the nature of capital costs even though customarily charged to expense in the year in which they are incurred. (31:4718)

In his 1957 cost study (Exh. 150) Kahn again employed the "crude only-pumping-nil gas/oil ratio" category for his liquid leg. He noted that this sample for the year 1957 was even smaller than had been the case in 1955, but he concluded that the sample was nevertheless adequate, stating:

> You will note from line 8 of that schedule that the production on such leases now amounts to only about ¾ of one per cent of the total crude oil production of the Southern and Central Divisions; this raises a question of whether the sample is adequate. I have satisfied myself that it is, and that the figure of $1.572 per barrel it yields is a correct one for the following reasons: (a) The figure differs by only three cents from that $1.542 that I obtained from the comparable sample of leases in 1955—see Exhibit 75–B, Schedule 4, line 3—a sample that accounted for 2.42 per cent of total production; (b) the average expense per barrel on all leases in the crude-only category, which accounts for 23.7 per cent of total production,

> is, as one would anticipate, somewhat lower, $1.403—I ignore here any costs associated with incidental gas sales from these leases—and (c) the expenses of all crude-only leases *excluding those showing what Mr. Joseph refers to as incidental sales of gas* amount to $1.568, almost the identical figures; and that group had production of 3,812,000 barrels, or about 20 per cent of the total output of the Southern and Central Divisions. (45:6773–74; emphasis supplied)

Tidewater further attacks Kahn's "liquid leg" on the ground that the particular leases in his "crude only-pumping-nil gas/oil ratio" sample are among the oldest and least profitable (highest cost) leases in Tidewater's total operations"; that accordingly "the use of the operating costs obtained from this antiquated sample group . . . results in an unrealistic shift of costs to liquids." In order to demonstrate this point, Tidewater contends that Kahn's 1957 cost-of-service reflects a cost of $4.32 per barrel "for liquids produced from the more recently developed *gas-condensate* leases, and a cost of $4.51 per barrel for the year 1955." The Tidewater brief then goes on to state:

> "When the Intervenors' cost of service witness was confronted with the fact of this absurdly high cost for liquids, his only defense was that he was interested in the cost of gas and not in the cost of liquids." (initial brief, pp. 50–51)

This statement represents an inaccurate characterization of Kahn's answer to this problem, which he discussed at great length during the course of a cross-examination by Tidewater counsel running from 48:6942–7008.

It is important at the outset to bear in mind that this entire point as made by Tidewater relates to the allocated cost which would allegedly (under Tidewater's own computation in its excluded Exhs. 159 and 160) be attributed to the *condensate* produced by the gas-condensate leases, as a result of applying Kahn's relative cost method. Kahn's basic answer to this point was as follows:

(1) He emphasized that the really significant question here was whether under his relative cost method an appropriate proportion of the joint costs was allocated to *gas* on the one hand, as distinguished from *all non-regulated portions of the business* on the other (*including both crude oil and condensate*). He concluded that on the basis of the various "checks" which he had made he was satisfied that, in a general way, there was no difficulty on *this* basic, significant ground. (48:6987)

(2) He expressed serious doubts as to the meaningfulness "of trying to determine an average total cost all the way up and down the line *for condensate alone*, "which he characterized as a by-product of gas. (48:7000) He did not deny that if the same methods were used to ascertain a cost-of-service *for condensate* as he had used for gas, the results would be similar to those computed by Tidewater. However, he stated:

> But I am uncertain about what happens when you move off the lease and try to obtain costs for the condensate or natural gas liquids part of the business.
>
> And of course you will recognize that it is the off lease expenses which are the major portion of this total expenses that you got of six and a half or seven million dollars, or whatever it was. It is primarily the off lease. (48:6988)

Kahn referred to testimony by intervener witness Botset that it would be impossible in most cases to produce the liquids from the gas-condensate wells if it were not for the presence of the gas itself. Under the circumstances, he raised a question as to what was the point of

. . . trying to say independently, what is the full average total cost of producing those liquids which are incidentally brought up by the gas? (48:6989)

* * * * * * *

. . . I can't see much point in taking this byproduct, the liquids, and sort of cutting a slice through the costs all the way up to the president of the Tidewater Oil Company and saying, 'Let's put this all down on this column'. (48:6990)

* * * * * * *

But I am trying to keep a certain sense of proportion about its meaningfulness, and it is on that score, for the reasons that I have indicated, that I have some skepticism. (48:5990–91)

Tidewater counsel finally posed the direct problem as follows:

Doctor Kahn, assuming that your cost of service for the year 1955 shows that the cost of crude is two dollars a barrel and the cost of condensate is four dollars and fifty cents a barrel, does that fact, or would that fact, in your mind, raise serious doubt as to the validity of your cost of service determination? (48:6994)

Kahn replied:

It does give me pause, but as I look at my cost of service, and the critical question as I see it and I have posed it several times is gas being attributed a fair or reasonable or in some sense adequate share of total cost *as compared with the nonregulated part of the business*, basically that seems to me the appropriate test.

Now, obviously if the test that you suggest is the appropriate test, I would have real questions about it. But it seems to me that we do have to keep a certain sense of proportion about what this company's business is. And if you do show on the 1.8 million barrels of condensate production a result which seems, to put it mildly, anomalous, it seems to me the more significant question is, what result does it show on the 19.3 million barrels of liquids—of oil—or, if you will, the 21.0 million barrels of all liquids, because that is the basic distribution. And while I concede that I must think about this, and I think about it more, so far as I can see, if I decide whether or not my cost of service is basically sound or not by the test that you are mentioning, I must emphasize the extent to which you are picking out the 1.8 million barrels and leaving out the 19.3 million barrels. (48:6995–96; emphasis supplied).[22]

* * * * * * *

Now, as for this question, in the light of the overriding question, which is the reasonableness of the costs imposed on gas on the one hand and the other part of the business on the other, I cannot believe that a continued consideration of the fact presented to me today . . . would produce a basically different cost of service.

Please notice what this means. . . .

* * * * * * *

. . . if crude oil alone earned twenty-eight percent on its investment—and this is by far the more important part of the business—it certainly suggests to me that I can hardly be accused of having by my methods produced a result which puts too much of the costs on the nonregulated part of the business.

[22] Kahn noted in this connection that Tidewater's 1955 revenues from crude oil were $54.5 million, while its condensate revenue amounted to only $3.9 million. (48:7001)

> I do concede that to the extent that it is appropriate to cut this line up and down—and I have suggested that I am not sure that it is—that on this much, much smaller portion of the business, it does look as though too high a percentage of costs has been put on it.
>
> But in evaluating whether this would cause me, Hamlet-like, to make a major change in the results that I have achieved, I would emphasize these two concluding points, which induce me to say that I very much doubt that it would.
>
> First, the fact that this is so much less important than the other, and that when we put them both together by this same test that these people are applying, it comes out intelligently; and secondly, that I have serious doubts of the kind that I have just mentioned about the meaningfulness of trying to determine an average total cost all the way up and down the line for condensate alone, which is a by-product of gas. (48:6999–7000)

It is concluded that Kahn's analysis of the problem, as set forth above, represents an effective answer to this Tidewater position, and the Tidewater contention that the use of Kahn's "crude only-pumping-nil gas/oil ratio" sample results in "an unrealistic shift of costs to liquids" is found to be without merit.

Tidewater counsel made a further attempt, during the hearing, to discredit Kahn's liquid leg for 1957, by calling attention to the fact that Kahn did not use the identical "crude only-pumping-nil gas/oil ratio" leases for his 1957 sample which he had used in his 1955 sample—citing four Illinois leases which were particularly *low cost* leases, which *allegedly* met Kahn's standards for the "crude only-pumping-nil gas/oil ratio" category, but which nevertheless were dropped from his 1957 sample, although they had been included in his 1955 sample. The inference left on the record was that Kahn might have elected to omit these particular leases from his 1957 study because they would have had a downward impact upon the unit cost derived for oil under his relative cost method. (48:7030-34)

The Presiding Examiner then expressed his unwillingness to leave the record in this uncertain state, called attention to the fact that the information as to whether these particular leases *did* in fact meet Kahn's own standards for his "crude only-pumping-nil gas/oil ratio" category was peculiarly within the exclusive possession of Tidewater itself, and accordingly requested Tidewater counsel to check with his staff in the hearing room so that the precise facts might be put into the record. Tidewater counsel thereupon replied:

> After conferring with the Tidewater people here at the table, it appears that nobody is qualified to testify one way or another about that. (48:7035)

The Presiding Examiner then stated:

> Well, we will be in session later in the week, and I would suggest that you get some more precise information, and when you have the information to your satisfaction, maybe you can get it on the record.
>
> MR. ATTWELL: All right. Fine. (48:7037)

At the next day's session, however, intervenor counsel called attention to the fact that on July 28, 1959 Tidewater itself had addressed a letter to the intervenors which set forth a listing of gas-oil ratios on pumping only leases; that the data therein set forth with respect to these four particular Illinois leases made it perfectly clear that they did *not* fall within Kahn's definition of his "crude only-pumping-nil gas/oil ratio" category. (49:7051–52) In spite of this disclosure, Tidewater counsel made no effort to withdraw his charge,

but on the contrary suggested that Tidewater might possibly have inadvertently erred in its listing of the gas/oil ratios for these 4 Illinois leases in its July 28, 1959 letter; that those leases might actually (contrary to the information set forth in Tidewater's own letter) have had a very low gas/oil ratio, and that he would like the opportunity to check into the matter further. (49:7052–54) The Presiding Examiner then commented upon the entire situation as follows:

> . . . what happened yesterday left the impression that in the view of Tidewater Oil Company, based on the information you had, Dr. Kahn had not even been consistent with his own standards.
> It turns out now that we have one of two possible alternatives. It may either turn out that you were in error yesterday in the sense that the information which you gave the interveners at their request on those four leases may have been correct information and that, therefore, you were in error yesterday in suggesting that Dr. Kahn did not consistently follow his own standards.
> Or, the only other alternative that I can see is that when Tidewater Oil Company provided the requested information to the interveners sometime ago they gave the interveners the wrong information.
> The only reason I am making this comment, Mr. Attwell, is that it seems to me that since, as I stressed yesterday on the record, this information is all peculiarly within the sole possession and knowledge of Tidewater Oil Company and nobody else, I would be much disturbed to find that through the lack of care in providing information to staff or interveners in response to their request a situation might have been created in which it should now become necessary to go through other steps to modify studies which were made in good faith upon the basis of information requested of the company.
> That is the only comment I can—I am going to make about it now.
> All right.
> MR. ATTWELL: I presume there is no response necessary to that.
> PRESIDING EXAMINER: No.
> (49:7054–56)

Curiously, this matter was not thereafter raised or referred to in any way by Tidewater during the remainder of the hearing, and no reference is made to this point in the Tidewater briefs.

The District 16–3 Leases and Kahn's Shift to Recent Vintage Leases for Allocation of Net Investment

It has already been noted at an earlier point in this decision that Kahn did not include certain District 16–3 leases in his gas leg in his Exh. 150 cost study; that subsequently, during the latter stage of the hearing, when Tidewater for the first time made available certain information showing how the depreciation and depletion charges could be distributed to those particular leases, Kahn prepared and presented a new 1957 cost study, Exh. 180, in which the District 16–3 leases were added to his gas sample. He at the same time explained that it was no longer satisfactory or meaningful, under those circumstances, to use "all vintage" leases for the relative cost allocation of on-lease net investment, as he had done in Exh. 150; that he had accordingly switched in Exh. 180 to the use of "recent vintage" leases in the 1950-57 age group for that particular allocation.[22]

[22] Kahn's rationale for this change will be explained more fully at a later point.

In discussing this change Tidewater states:

> For example, when confronted with the fact that the sample set of 'preponderantly gas' leases used in their initial 1957 cost of service presentation (Exhibit 150) did not contain certain important leases in the Hollywood Field, though such leases met the definition and standards which the Intervenors themselves had established, their cost of service witness stated that a change in the 'gas leg' would also require a change in the 'liquid leg'. (initial brief, p. 49)

Tidewater then quotes the following colloquy between the Presiding Examiner and Kahn:

> Q. (By Presiding Examiner): Do I understand, Dr. Kahn, that what you are saying here is that if the District 16–3 leases are in fact to be now included in your gas leg for the purpose of your relative cost method of allocation of rate base, that you woud feel it necessary for the reasons which you have now summarized to modify the gas leg in correcting that allocation to shift from the use of the all vintage leases which you in fact used in that 1957 study to the use now of recent vintage leases and that the purpose of Exhibits 178 and 179 is to put into the record the data which would make it possible to make that change?
>
> THE WITNESS (Dr. Kahn): That is right, with the addition that I would have to make a corresponding change in the crude oil category and one of the exhibits contains that necessary information as well. I just don't want to be precluded from using this new information as my judgment dictates and as I would have been free to do so had I had it when I originally prepared my 1957 presentation. (52:7438–39)

Tidewater then characterized this colloquy as follows:

> In short, when the error in the 'gas leg' was disclosed, the Intervenors' cost of service witness also revised his *judgment* concerning the 'liquid leg,' with the result that the relative cost allocation ratios became even less favorable to gas. (initial brief, p. 49)

This does not appear to be a completely accurate characterization of what occurred.

As already noted at an earlier point in this decision, it is quite unfair and inaccurate to suggest that Kahn's failure to include the District 16–3 leases in his gas sample in his Exh. 150 cost study constituted an "error" with which he was "confronted" and which was "disclosed" for the first time when he was cross-examined by Tidewater counsel. The fact is, as noted above, that Kahn himself (six months prior to this time) had called attention to the fact that the District 16–3 leases had not been included in his gas leg in Exh. 150, and had explained the omission. (Exh. 150, Sched. 4, footnote 5) The Tidewater brief also leaves an inaccurate impression when it states that Kahn testified that a change in the "gas leg" (*i.e.*, the addition of the Dist. 16–3 leases) "would also require *a change in the 'liquid leg' . . .*"; and when it further states that "when the error in the 'gas leg' was disclosed, the Intervenors' cost of service witness also *revised his judgment concerning the 'liquid leg'* . . . ." (emphasis supplied) The fact is that as a result of the addition of the District 16–3 leases to his gas sample in Exh. 180, Kahn swtched to the use of "recent vintage" leases *for both his gas leg and his liquid leg*, in connection with his relative cost allocation of on-lease net investment.[31]

[31] Tidewater itself expressly notes this fact in its reply brief, p. 10–11.

In summarizing certain changes which Kahn made in his various cost studies from time to time during the instant proceeding, Tidewater notes (initial brief, pp. 21-26) that in Kahn's 1955 cost study (Exhs. 75–B and 76–B) he had used *different* lease samples for allocating on-lease expenses than for the allocation on-lease net investment—*i.e.*, "all vintage" leases for on-lease expenses, and "recent vintage" leases of the 1950-1955 age group for on-lease net investment. Tidewater further notes that in Kahn's first 1957 cost study, Exh. 150, he used the *same* lease samples to determine the relative cost factors for the allocation of both on-lease net investment and on-lease expenses—*i.e.*, "all vintage" leases. (initial brief, p. 25, footnote 34) Tidewater finally notes that in Kahn's final 1957 cost study, Exh. 180, after adding the Dist. 16–3 leases to his dry gas sample Kahn at the same time switched again to the use of *different* lease samples for the purpose of allocating on-lease expenses and on-lease net investment—*i.e.*, employing "all vintage" leases for on-lease expenses, and "recent vintage" leases of the 1950-1957 age group for on-lease net investment. (initial brief, p. 26, footnote 36)

Tidewater cites these changes, among others, in Kahn's various cost studies as evidence to support its charge that:

> Throughout this proceeding, as their various cost of service studies were presented, the methods, principles and costing techniques were constantly changed to coincide with the subjective ideas of the Intervenors' cost of service witness. The most flagrant example of the Intervenors' vacillation was their use of continually changing samples in order to establish relative cost factors for the allocation of production expenses and investment. (initial brief, p. 21)

Finally, in its reply brief Tidewater calls attention to the fact that the Commission in its *Phillips* decision used *all* leases in the "100% oil" category for the liquid leg of its relative cost allocation of *both* direct expense and direct net investment. Tidewater therefore attacks Kahn's shift to "recent vintage" leases for his allocation of on-lease net investment in Exh. 180 as an unjustified departure from *Phillips*, stating:

> The Commission did not restrict expense lease sample to leases of 'comparable recent vintage' for any purpose, but assured itself that it had a lease sample broad enough to cover all phases of the relative cost allocation. By way of contrast, the Intervenors have arbitrarily assumed that one group of leases is appropriate for the 'liquid leg' of their relative cost allocation of direct expense but is not appropriate for the relative cost allocation of direct net investment. They do not attempt to explain this dichotomy on a factual basis, but rely solely on the subjective opinion of their cost witness to justify the use of two different liquid factors for the relative cost allocation of direct expense and direct net investment. (reply brief, pp. 7-8)

Tidewater cites the above history as evidence to support its characterization of the Kahn presentation as

> little more than an arrangement which first determines the answer and then dips into a huge volume of detail in the record for the selection of those leases which will provide the desired allocation ratios and lend some color of rational support for an answer which is inescapably arbitrary. (initial brief, p. 49)

In order to fairly evaluate this criticism, it will be helpful to summarize at this point the manner in which this problem arose and developed—and its treatment by Kahn.

It is important to bear in mind here that the technique of using "recent vintage" leases for the relative cost allocation of on-lease net investment, while adhering to the "all vintage" lease samples for the allocation of on-lease expense, was not a device which Kahn invented *after*, or to counteract the effect of, the addition of the District 16–3 leases to his gas leg in Exh. 180—which occurred during the latter stages of the hearing, in April 1960.

On the contrary, Kahn had used this very technique in his Exhs. 75–B and 76–B *1955* cost study, presented in May 1959, and had there explained the reasons for adopting that technique in great detail. He had then noted that the liquid sample employed for his Exh. 75–B allocation of on-lease expenses, consisting of 20 pumping leases with nil or negligible gas production, involved leases which were unusually far advanced in terms of their producing life; that, as a result, their annual production had declined so significantly that the original investment cost, when divided by current production, produced a *gross* investment cost per barrel which was unrealistically high; that at the same time they were depleted on the books far more than their annual production capacity had declined, with the result that their *net* investment was unrealistically low; that this resulted in a net investment cost per unit of current production which was much lower than that on some younger leases, in spite of the fact that this discrepancy did not have any particular significance for the purpose of the objective sought in the relative cost allocation. By contrast, the imputation factor *for gas* was derived from the much younger and typically far less fully depleted gas-condensate leases. The net result was that if "all vintage" leases were used for the allocation of on-lease net investment, the imputation factors derived for liquids and gas would relate to widely divergent periods of time, and would accordingly be in widely divergent degrees unrepresentative of the cost at any particular time of duplicating the services. Kahn concluded that this would be inconsistent with the basic rationale of the relative cost method, which was to divide the joint costs of the multiple purpose investment in proportion to the costs of providing the several single services—amounting in actual practice to computing the alternative justifiable expenditures for each individual product at some given point in time. He concluded that the solution to this problem of eliminating the inconsistency or non-comparability arising from the use of imputation factors of varying ages was to compare the crude oil-only leg and the gas-only leg from leases of roughly comparable and preferably recent vintage, and he accordingly derived his imputation factors in Exh. 76–B for both gas and liquids from "recent vintage" leases of the 1950-1955 age group (31:4734–38)

At the conclusion of this explanation, Kahn was asked by intervenor counsel whether a problem was not raised by his use of one group of leases for the determination of the imputation factor for on-lease expenses, and another group for the allocation of on-lease net investment. He answered as follows:

> A. I have made some checks on this possibility, and satisfied myself that no significant distortion is introduced by this procedure. First of all, please recall it is not the absolute figures that are important, but the relationship between the imputation factors for liquids on the one hand and gas on the other. Since I use leases of similar vintage for both groups of products in each application of the relative cost method, the relationship between the two imputation factors is not necessarily distorted by the fact that I used all age groups to allocate expenses and the 1950-1955 group to allocate investment. Second, I investigated the relative *expenses* of producing oil or gas on wells in the 1950-1955 group

only, and find that the oil expenses in that group are comparatively higher than those for gas. If, therefore, I had used 1950-1955 leases for both expenses and investment, the result would have been to reduce the final gas cost-of-service by about 4 mills. I do not recommend this procedure because of the thinness of the sample on which the imputation factors would in this case be based. (31:4738–39; emphasis supplied)

The next development occurred when Kahn presented his 1957 cost study, Exh. 150, in January 1960—where he employed the *same* lease samples for both on-lease expenses and on-lease investment, using "all vintage" leases in both cases. He at this time repeated his earlier comment with respect to the crude oil-only sample stating:

I have pointed out several times in my original testimony that the net investment per unit of production on the sample of crude oil-only leases is unrepresentatively low for precisely the reason that makes those leases a good indicator of the cost of lifting oil in the absence of gas. They are old and almost completely written-off on the Company's books. (45:6792)

However, he gave the following explanation as to why he had now (in Exh. 150) reverted to the use of "all vintage" leases for both on-lease expenses and on-lease investment:

. . . in the case of the 1957 figures, I found that I could without significant distortion simply use the same groups of leases for the computation of the oil-only legs as I used in the case of expenses, excluding only those showing no or negative investment.

Q. In your supplementary 1955 testimony, however, you argued at some length that the net investment figure for the crude-only leases of all vintages was unrealistically low, and the gross investment unrealistically high, and for this reason contended that it would be better to use leases of similar age. Have you changed your mind about the logic of that argument?

A. No. I believe, as before, that the $1.83 net and the $12.93 gross investment per barrel of crude oil shown in Schedule 10 are both unrealistic, the one on the low side and the other on the high side. I have already indicated at some length in my earlier testimony why this is so—*however, the important result of the selection of imputation factors is the ratio between the two, and I find that the ratio between the net investment figures of $1.83 per barrel of oil and $0.1278 per Mcf of gas*, the latter derived in Schedule 11, *a ratio of approximately 14 to 1, is sufficiently close to the ratios that would be obtained by using other categories of leases, of more recent vintage, though somewhat lower, as to justify following this simpler procedure in the present instance.* (45:6805–6806; emphasis supplied)

The next important development in this connection occurred at a hearing session in April 1960, when Tidewater counsel offered in evidence some 24 new exhibits and related explanatory testimony (Exhs. 151-175), for use in connection with his projected further cross-examination of Kahn. The Presiding Examiner excluded all of this material (47:6891), on the following grounds: (1) that a substantial portion of the new material involved an attempt by Tidewater to present 1958 data, which might have the effect of requiring new and further cost studies on the basis of a 1958 test year—and that no justification had been shown for any such step at that late stage of the proceeding; (2) that a substantial part of the new material actually was in the nature of surrebuttal, and that there was no justification for opening the door to

such further complications at this late stage of the proceeding; (3) that these unnecessary complications could be avoided, while still providing Tidewater counsel with a full and fair opportunity to complete his testing of Kahn's latest cost studies, through the vehicle of cross-examination without the use of such exhibit material. (47:6852–69)

It appeared that in one of the proposed Tidewater exhibits included in the mass of excluded material, Exh. 153, Tidewater had set forth a breakdown of the District 16–3 leases, showing the distribution of depreciation and depletion charges to those particular leases, and had on the basis of this data added the District 16–3 leases to Kahn's gas leg. [25]

During the course of his cross-examination of Kahn on the following day, Tidewater counsel squarely raised and made a substantial point of the fact that Kahn's Exh. 150 cost study had excluded the District 16–3 leases from the gas leg. (48:7037, *et seq.*) In the course of this interrogation, Kahn indicated that although he had not previously been able to include the District 16–3 leases for the reason that the Tidewater books failed to show how the depreciation and depletion charges could be distributed among those leases, this situation could now be remedied on the basis provided in Tidewater's excluded Exh. 153, if there was also provided the data showing the estimated reserves under each of these leases and the remaining net investment for each. Tidewater counsel then explained that any additional data required for this purpose would be found in the work papers underlying the said exhibit. (48:7040–41)

In order to resolve this problem once and for all on the record, the Presiding Examiner requested Kahn and the intervenors to check into the matter further and to make a final determination, on that basis, as to whether it would be desirable and important to now add the District 16–3 leases to the gas leg in Kahn's 1957 cost study. Kahn expressed his willingness to do this. However, he called attention to the fact that at the time of his Exh. 150 testimony he had noted that the net investment figure for the "all vintage" crude-only leases was unrealistically low, and the gross investment was unrealistically high, and that he had then indicated his preference *as a matter of principle* for the use of oil and gas leases of comparable and recent vintage; that, however, the important result of the selection of imputation factors was the *ratio* between the two; that although the net investment for the "all vintage" crude-only leases in Exh. 150 was very low, the gas net investment figure seemed to be low too; that this had resulted in a ratio of approximately 14 to 1, between the oil and gas net investment figures in Exh. 150, using "all vintage" leases; that although the 14 to 1 ratio was somewhat low, he had concluded at the time that it was sufficiently close to the ratios that would be obtained by using other categories of leases of more recent vintage, to justify, *on a purely pragmatic basis*, the simpler procedure for Exh. 150 of using the same "all vintage" leases for net investment as for on-lease expense.

Kahn pointed out, however, that the Dist. 16–3 leases were all of recent vintage, being of 1950 or later vintage; that if they were now added to his Exh. 150 gas leg, the result would be to produce a substantially lower ratio between the oil and gas net investment figures, amounting to around 10 to 1, which was far out of line and unrepresentative; that the result would be to completely vitiate the circumstances which had made it appropriate in Exh. 150, on a purely pragmatic basis, to rest upon the use of "all vintage" leases for the net investment allocation. He accordingly stressed that if the Dist.

[25] This information still did not appear upon the Tidewater books, but was provided only, and for the first time, in the above-mentioned proposed Tidewater Exh. 153. (48:7046–49)

16–3 leases were now to be included, it would become logical and imperative to further adjust Exh. 150 to use gas and oil leases of comparable vintage for net investment—*i.e.*, to use gas and oil leases of "recent vintage" only. (49:7093–95)

As a result of these further developments, Kahn subsequently prepared and presented his final 1957 cost study, Exh. 180, in which the Dist. 16–3 leases were added to his gas leg, and in which he accordingly switched back to the use of "recent vintage" leases for on-lease net investment, while continuing to use "all vintage" leases for his allocation of on-lease expense. At this time he summarized his entire position on this matter as follows:

> Q. What changes were required in the allocation of on-lease investment?
> A. The leases in the 16–3 district are all of recent vintage. Since the production of those that now fall into our preponderantly gas-producing category exceeds the entire production of all leases included in that category in Exhibit 150, the effect of introducing these important new leases is greatly to increase the net investment cost per Mcf of gas. In Exhibit 150, I used for my oil and gas legs leases of all ages. Both groups, composed for the most part of old and heavily depleted leases, produced very low per unit costs unrepresentative of the current investment cost of a barrel or an Mcf of current production capacity because both suffered from the same infirmity; together they produced a ratio which I found usable. The addition of the 16–3 leases makes the gas leg far younger and far less depleted than the oil leg, and consequently produces an unrealistic ratio between them. I therefore turn to producing leases in the 1950-57 age group only.
>
> * * * * * * *
>
> Q. How does the ratio between your present oil and gas net investment legs compare with the ratio used previously in your testimony?
> A. The ratio embodied in the present, revised 1957 presentation, incorporating the very important and low-cost 16–3 leases is 22 to 1. The ratio in my recommended 1955 cost of service was 26 to 1, and in my original 1957 cost of service presentation, 14 to 1.
>
> * * * * * * *
>
> Q. Do you recommend the present allocated cost of service as superior to the earlier one?
> A. Yes, without qualification. It differs for two reasons only—first, because it incorporates the important, additional information supplied me by Tidewater, and, second, because it employs the rate base allocation method which I have already maintained is conceptually superior to the ones I actually employed in the original 1957 presentation. (53:7486–88)

Kahn also provided a final summary of his position as to the propriety of employing different lease samples for the allocations of on-lease expense and on-lease net investment in the following colloquy with Tidewater counsel:

> Q. Now, in computing your on-lease expense ratios, I believe you use leases of all ages.
> A. For expenses purposes.
>
> * * * * * * *
>
> Q. And you used leases of recent vintage for investment purposes?
> A. That is right.
> Q. Do you think there is any inconsistency of this application of the ratios, Dr. Kahn?
> A. No; I do not.

Q. Why not?

A. Well, I have explained that at extraordinary lengths, Mr. Attwell, both in my revised 1955 presentation in which I followed precisely the same procedure, and in my cross examination when several times I indicated why I felt such a procedure should be used.

Essentially, as I pointed out both those times, I felt that the leases of all age categories were not unrepresentative here of what the relative cost method called for so far as expenses were concerned, but were grossly distorted for the purposes of ascertaining net investment imputation values. (54:7496–97)

It is concluded here that it was desirable and appropriate to add the Dist. 16–3 leases to the gas leg in Kahn's 1957 cost study. It is further concluded that it was necessary and proper, for the reasons set forth at length in Kahn's testimony, to employ "recent vintage" leases for both the liquid leg and the gas leg in connection with the relative cost allocation of on-lease net investment, as was done in Exh. 180; and that the use of different lease samples for the allocations of on-lease expense and on-lease net investment was not improper or undesirable under the circumstances. It is finally concluded that the shifts which occurred in Kahn's treatment of this matter in his 1955 and 1957 cost studies were quite understandable under the circumstances as outlined above, and that there is no valid basis for the Tidewater charge that these changes were made merely "to coincide with the subjective ideas of the Intervenors' cost of service witness".

Indirect Expense and Indirect Net Investment

In allocating indirect expense (off-lease expense) and indirect net investment (off-lease investment) under the relative cost method, both Tidewater and the Staff applied the same allocation factors which had been derived for direct expense and direct net investment. Staff describes this procedure as following ". . . the Commission preference for allocating other production expenses on the same basis as direct production expenses . . .". (initial brief, pp. 13-14)

Intervenor witness Kahn, however, used a conglomerate average method under which off-lease production expense, other than regulatory expense and gas processing plant expense, was allocated to gas by use of the average (12.43%) of the following percentages:

(1) Per cent of on-lease expense other than depreciation and depletion expenses allocated to gas (3.35%);

(2) Per cent of total on-lease net investment allocated to gas (23.43%); and

(3) Per cent of total on-lease gross investment allocated to gas (10.52%). (Exh. 150, Sched. 7)

Similarly, off-lease net investment, other than gas processing plant investment, was allocated to gas on the basis of the average (16.98%) of the following percentages:

(1) Per cent of on-lease net investment allocated to gas (23.43%); and

(2) Per cent of on-lease gross investment allocated to gas (10.52%). (Exh. 150, Sched. 13)

Tidewater attacks this intervenor procedure as an unwarranted departure from the allocation methods used by the Commission in *Phillips*. (reply brief, p. 12)

Actually, the method here employed by Tidewater and the Staff is itself not precisely identical with that used in *Phillips*, where a totally separate relative cost allocation was made of indirect expense, constructing and applying totally different allocation factors than were used for direct expenses. The only discussion with respect to the indirect expenses in the Commission's

Phillips decision occurs at pp. 553-555 of Op. 338. In there holding that the distribution should have been made "on the basis of direct operating expenses," the Commission was referring to a preliminary step under the relative cost method—involving the distribution as between 100 per cent oil leases and joint product leases of that portion of indirect expenses allocated to Phillips' Oil and Gas Production Department. It therefore appears that even the method advocated in the instant proceeding by both Tidewater and the Staff for the allocation of indirect expenses represents some departure from the procedure which was followed in *Phillips*.

Intervenor witness Kahn explained his rationale for allocating indirect expense on the basis of conglomerate averages as follows:

> Q How do you support the application of the composite percentage to which you have just referred to the other two major off-lease expenses, general and administrative, and other operating expenses, general and administrative, and other operating expenses and taxes?
>
> A The answer to your question is really quite simple. What we have under these two headings is a great conglomeration of expenses, of an extraordinary variety. The two largest items in the second category, for example, are employee benefits, amounting to $683,000, and an item entitled "Profit and Loss on Property Retirement—Net" of $684,845. Other large items are "Overhead—Production Department", city, county and state property taxes, insurance, and so on. Some of these, it seems, are most closely related to the current value of property, and ought therefore to be allocated on the basis of net investment—among these I would be inclined to place insurance, property taxes, and possibly storm damage. Others, it seems to me, are more appropriately related to on-lease expenses, particularly if we exclude from the latter depreciation and depletion: among these I would be inclined to classify overhead of the production department, cash discounts, to the extent that they reflect supplies purchased on the lease, and that portion of employee benefits that is related to labor on the lease.
>
> A few other items are probably most appropriately related to gross investment—for example, "Inventory Adjustment—Material and Supplies," since we allocate working capital, material and supplies, on that basis, and possibly, again, the overhead of the production department, on the ground that the amount of effort directed toward managing producing leases is more clearly related to the gross investment than to the extent to which they may be depleted. Finally, I would suppose that gross production taxes and Federal and State excise taxes are best allocated in proportion to sales realization.
>
> Q How is one to weigh these rather complicated considerations?
>
> A I believe it is necessary to retain a certain sense of proportion here. First of all, I think it would be unnecessarily complicated to try to allocate each one of these subentries individually by the formula that seems most appropriate to it. Second, the two extreme allocation bases are on-lease net investment, which would by my allocations place 23.4 per cent on gas, and on-lease expenses excluding depreciation and depletion, which would give it only 3.35 per cent. I believe we can quickly reject both of these two extremes as possible allocation formulae. To use the first, net investment, would imply that it somehow requires less management, less general and administrative expense and other indirect expenses, to run relatively old, depleted, or indeed over-depleted leases than the less old and depleted ones; it seems to me that this is clearly not necessarily true, and may

indeed be the very opposite of the truth. On the other hand, while, as I argued in my original testimony, there is a certain persuasiveness in a regulatory proceeding giving gas and oil the same percentage markups above direct cost, it is clear that many of these indirect expenses would seem to vary more closely with gross or net investment, or sales realizations, than with on-lease expenses. For these various reasons, I think by all means the most reasonable procedure is to average these allocation formulae, as I have done.

Q Did you make any attempt to see whether the resultant average bore any close relationship to such allocations as would have been produced had you attempted to take up the individual sub-categories of these indirect expenses one by one, allocating each on what seemed to you the most plausible basis?

A I have, and it was because the results of that effort came so very close to the simple average of these allocation bases that I decided for simplicity to use the latter. (45:6797-6800)

Similar considerations induced Kahn to use conglomerate averages in his allocation of indirect net investment. (45:6809-10)

It is concluded that the Kahn method makes sense under the circumstances of the instant case, and it is hereby approved. [36]

Conclusions With Respect to the Relative Cost Allocation of Joint Production Costs

In evaluating, finally, the general validity or usefulness of the relative cost allocation method, in all its aspects, as here applied by intervenor witness Kahn, all parties agree that the results are to be assessed in the light of the fundamental principle underlying the relative cost method—*i.e.*, that both of the joint products should share whatever efficiency and reduction in costs may be reflected in the joint product operation.

In this connection, intervenor witness Kahn pointed out that the ultimate effect of his relative cost allocation was to produce a reduction of 52 percent for the cost of liquids produced from joint product leases, as compared with the cost for liquids produced from the single product leases—whereas the cost derived for gas produced from the joint product leases was 47½ percent less than that for the single product leases. Kahn noted that the resultant reductions for both liquids and gas were thus of a similar order of magnitude, and that in fact under his method the liquids showed a slightly greater benefit in cost savings from the joint production operation than was true for gas.

Tidewater counsel, however, insisted that the comparison should be made between gas on the one hand, and *natural gas liquids (or condensate) only*—and not with the broader category of *all* liquids. If the comparison is made on this basis, it shows that Kahn's method results in a cost of *condensate alone* from the joint product leases which was 38 per cent lower than the cost factor used for *all liquids* produced from single product leases, whereas the cost derived for gas produced from joint product leases was 44 percent lower than that produced from single product leases. On the basis of this particular comparison, Tidewater counsel suggested that Kahn had assigned a greater reduction in cost for gas than for liquids.

[36] It should be noted that the net dollar difference which may be attributed directly to the difference between these two approaches is actually not significant. The substantially higher level of the allocation ratio derived for gas under the Tidewater method is attributable much more directly and significantly to the fact that Tidewater employs totally different gas and liquid legs than are used by Kahn, in constructing its allocation factors for direct expense and direct net investment.

However, as Kahn pointed out, it seems clear that the significant comparison to be made here, from the point of view of the regulatory process, is that between gas on the one hand and *all liquids* on the other. The comparative data relied on by Tidewater are therefore not regarded as relevant.

Furthermore, even if the comparison were in fact to be made between the figures for gas on the one hand and condensate on the other, Kahn explained that the slight disproportion or discrepancy remaining with respect to that particular category of leases was accounted for and justified by his gas volume adjustment—which has been discussed at length and approved at an earlier point in this decision. He stated:

> Third, there is a reason for that disproportion, that slight disproportion between the sixty-two percent and the sixty-six percent that you mention, and that is, as I indicated in my redirect testimony several years ago, I thought it appropriate to modify the precisely proportionate reduction in expenses imposed on both products, because I was seeking some method of giving gas credit for lifting the liquids, and that method was the one we have described of imputing the single purpose product cost to the gross or estimated gross production of gas. And then on the basis of the fact that the difference between gross and net production of gas, and the costs justly attributable to that difference, are appropriately attributable to raising the liquids, imposing on gas only a total burden equivalent to what would be appropriate to the marketed production of gas. I believe that that will account for either all or the major part of the remaining slight discrepancy that remains in this particular category of leases.
>
> Q Dr. Kahn, as I understand your explanation, it is that if you had not made the volume adjustment, to which you referred and which we will discuss more thoroughly later on, then the joint products would have shared proportionately in the cost savings—or shall I say that the difference that now exists would have been narrowed substantially; is that correct, sir?
>
> A Yes, it would be narrowed, I would assume substantially; but I have not made the computation. (50:7116-17)

At this point, having completed the analysis of the specific problems arising in connection with the intervenors' application of the relative cost method to the allocation of joint production costs, it would be useful to make a final evaluation of the grave charges made in the Tidewater briefs against the objectivity and sincerity of the cost studies presented in this proceeding by intervenor witness Kahn. Tidewater characterizes these cost studies in the following language:

> Perhaps the most objectionable feature of the Intervenor's cost of service determinations is the complete lack of objective standards. Throughout this proceeding, as their various cost of service studies were presented, the methods, principles and costing techniques were constantly changed to coincide with the subjective ideas of the Intervenors' cost of service witness. The most flagrant example of the Intervenors' vascillation was their use of continually changing samples in order to establish relative cost factors for the allocation of production expenses and investment. In short, the Intervenors' cost of service studies are permeated with so many crucial 'subjective' judgment factors that it would appear to be much simpler, and certainly more expeditious and forthright to disregard any sham mathematical computations and simply make a single subjective determination of Tidewater's cost of service per Mcf of gas. In fact,

> if the Intervenors' cost of service 'methods are to be adopted by the Commission, it will be necessary to have their cost of service witness ever present to make the necessary subjective variations. (initial brief, p. 21)
>
> * * * * * * *
>
> It is obvious from the record in this case that the Intervenors' application of the relative cost process is so permeated with subjective judgment factors, it bears little or no resemblance to what the Commission did in *Phillips*. In fact, on close examination, the entire relative cost method employed by the Intervenors appears to be nothing more than a mathematical ritual for arriving at some numerical relationship in order to arrive at a predetermined result. During the course of this proceeding, the numerical relationships used in the Intervenors' relative cost process were changed four times. In Tidewater's view, the Intervenors' failure to justify any of these changes creates grave doubt as to the objectivity, accuracy and regulatory validity of their entire relative cost process. (reply brief, p. 11)

In considering this Tidewater complaint, it is important to bear in mind the manner in which the instant case developed and proceeded. The Tidewater hearing, in its various stages, extended over a period from May 1956 to May 1960, and it was tried during a period when the Phillips case was also in process. The key problems involved, such as the problems of allocating joints costs, were difficult questions of first impression, as to which producers, the intervenors and the Staff were all feeling their way and plowing new ground. While the Tidewater proceeding was going through its various stages, the *Phillips* hearing, the *Omnibus* hearing, and other producer rate hearings were also being conducted. The situation was one in which the various parties, witnesses and counsel in the instant Tidewater proceeding were properly interested in observing and benefiting from the developments which were taking place, and from the ideas, methods and techniques which were being explored in such other proceedings. They were, of course, equally interested in reacting to and benefiting from the information and data developed during the various stages of the instant Tidewater hearing itself.

On the basis of his very extended observation of intervenor witness Kahn throughout the instant proceeding, the Presiding Examiner is impressed with the fact that Kahn at no time closed his mind to new suggestions or new approaches, and did not attempt at any time to evade problems as they arose or to pretend that they did not exist. On the contrary, he invariably sought an opportunity to give careful consideration to new problems and new material as they were presented. Thereafter, if his further study indicated the need for a change or modification in his previous approach, he unhesitatingly and frankly made such changes—explaining in detail on the record his reasons for making such changes, and their rationale.

In this connection, it is also important to note that many of the "changes" made by Kahn in the later stages of this proceeding involved situations in which he was induced to give consideration to new data which had not been made available at earlier stages of the proceeding. In some of these situations, Kahn had made it clear at the time his earliest studies were presented that he had felt compelled to adopt a given method or technique by virtue of the fact that he had not up to that time been able to obtain a certain described type of data from Tidewater—and his later modification or refinement resulted from the fact that such data had subsequently been made available. It is of the utmost importance, in this connection, to bear in mind that all of this data was peculiarly in the sole possession of Tidewater itself at all times. Under

these circumstances, the criticism directed against the intervenors in the Tidewater briefs seems quite unwarranted and misplaced.

With respect to the Tidewater charge that Kahn's application of the relative cost method bears "little or no resemblance to what the Commission did in *Phillips*, it must first be borne in mind that the Tidewater operations, of course, differ in some respects from *Phillips*. Under the circumstances, it was not possible or sensible in some instances to follow slavishly the identical technique which was employed in the *Phillips* decision. In addition, with respect to some situations the experience gained in the *Phillips* case and in the instant Tidewater proceeding indicated that a modification or refinement of the technique used in Phillips might be desirable. Here again, there was no virtue in rigidly cleaving to the precise *Phillips* method as a matter of ritual. At this stage of the regulatory process, when there is still so much to be learned with respect to the problems of producer regulation, no useful purpose would be served by rigidly closing our minds to any and all improvements or refinements of the *Phillips* techniques.

Under all the circumstances, it is here concluded that the above-quote Tidewater characterization of the cost studies presented by intervenor witness Kahn is without justification or merit, and it is accordingly rejected.

Allocation of Exploration Costs [37]

Tidewater advocates that exploration costs should be allocated between liquids and gas under the straight Btu method, based upon the relative Btu content of the test year production of these two products. Tidewater notes that the Commission in *Phillips* adopted a modified Btu method for the allocation of exploration costs, under which the Btu content of the liquids was weighted by an economic factor of four.

Tidewater contends, however, that in view of its product mix, the areas in which it operates, and the results of its exploratory activities, the economic factor of four which was used by the Commission in the *Phillips* case should be either substantially reduced or entirely eliminated for the purpose of the instant proceeding. In this connection, Tidewater points out that unlike *Phillips*, it does not conduct exploratory operations in the large, low-cost dry gas areas such as the Panhandle-Hugoton Field; that instead it has concentrated its exploratory and development operations in the deep, high-cost producing horizons of South Louisiana and the Texas Gulf Coast Areas. In addition, Tidewater lays great emphasis upon the fact that a major portion of its gas production is from gas-condensate leases, stating:

> In fact, over two-thirds of Tidewater's 1957 gas production was produced from gas-condensate reservoirs containing hydrocarbons in the gaseous form at high pressure (Exhibit 129). It is not until after the wet gas stream leaves the wellhead that the single gaseous phase is separated into liquids and gas. Thus, insofar as Tidewater's gas-condensate production is concerned, the application of an economic factor of four, which weights liquid BTU four times as heavily as gaseous BTU, is founded on the erroneous assumption that it costs more to find and replace one portion of a homogeneous reservoir and product stream than it costs to replace another portion.
>
> . . . Since there is only a single homogeneous product in the gas-condensate reservoir and at the wellhead, a process of cost allocation which

[37] It may be noted at the outset that "developmental dry hole" costs are here combined with other exploratory expenses and allocated on the same basis, following the Commission treatment in *Phillips*.

> allocates greater costs to one portion of the single gaseous form of hydrocarbons than to another portion results in serious error. Actually, the error inherent in the Commission's economic factor of four when applied to gas-condensate production is found in the assumption that the BTU content of the wet gas stream which separates into the liquid form after the production process is completed is more costly to find than the BTU content of the same wet gas stream which remains in the gaseous form. Therefore, Tidewater believes that the BTU method of allocation, without modification by any economic factor, is the only realistic and rational method of allocating joint exploration costs between the dry gas and liquid components of the single wet stream produced from its gas-condensate leases. (initial brief, pp. 54-55)

However, an examination of the considerations which led the Commission to reject the straight Btu method in its *Phillips* decision and to adopt a modified Btu method in its stead will make it clear that none of the above contentions by Tidewater have any relevance here. As already noted at an earlier point in this decision, the Commission in rejecting the straight Btu method in *Phillips* concluded that

> . . . if the Btu method is to be made practicable and useful for the allocation of costs it must be modified by the exercise of judgment based upon the facts and the principles that guide producers in the incurrence of costs. (Op. 338, p. 557)

The Commission then stressed that:

> . . . exploratory activities are directed to obtaining saleable products so that it seems reasonable that market relationships should also be reflected in the allocation. (Op. 338, p. 559)

In order to thus reflect the market relationships between liquids and gas, the Commission there developed and applied to the Btu content of the liquids an adjustment factor of four, based upon the *relative price ratio* of a barrel of petroleum to an Mcf of gas at the wellhead.

In this connection, it is important to note here (as pointed out earlier in this decision) that the Commission in the *Phillips* case applied its modified Btu method to *all* categories of leases, including gas-condensate leases, without distinction, in spite of the fact that the greatest part of *Phillips'* production from joint product leases came from gas-condensate leases. As earlier noted, Phillips' 1954 production of gas from gas-condensate leases, amounting to 78,499,506 Mcf, was substantially higher than Tidewater's 1957 gas production from gas-condensate leases, amounting to 61,695,657 Mcf. The argument made here by Tidewater to the effect that the alleged special characteristics of the gas-condensate leases require the adoption of a special and different allocation approach for the exploration costs relating to such leases, involves the same reasoning which was also used by Tidewater to justify its use of a special approach for the allocation of joint production costs relating to such leases. The defects in this argument with respect to the gas-condensate leases have been fully set forth at an earlier point in this decision in connection with the discussion of the allocation of joint production costs. The Tidewater attempt to single out the gas-condensate leases for special treatment in connection with the allocation of exploration costs is fatally defective for the same reasons, and it is hereby rejected.

In developing its theory with regard to the required special treatment of the gas-condensate leases with respect to allocation of exploration costs, Tidewater contends that the application of the Commission's *Phillips* economic

factor of four to Tidewater's gas-condensate production would be improper in that it would be "founded on the erroneous assumption that it cost more to find and replace one portion of a homogeneous reservoir and product stream than it costs to replace another portion." This argument reflects an incorrect interpretation of the Commission's purpose in applying the economic factor of four in its *Phillips* decision. It is perfectly clear from a reading of that decision that the Commission's adoption of the Btu adjustment factor of four in that case was not based upon a cost rationale at all, but rather was based upon the Commission's conclusion that in using the Btu method for the allocation of exploration costs fairness and a sense of reality required that the relative values of the liquids and gas must be reflected and given some weight in making this allocation. Under these circumstances, Tidewater's instant argument that the cost of finding the Btu content of the condensate liquid which ultimately separates out of the wet gas stream is not any different than the cost of finding the Btu content of the condensate gas, seems totally meaningless and irrelevant.[28]

In further support of its instant position, Tidewater makes an extended argument with respect to its increased costs of finding and producing gas—stressing such matters as the trend of increasing exploratory and development drilling costs, the trend of increasing operating expenses, the decreasing realization per Btu of total production resulting from the increasing role played by gas in its total production, and the like. (initial brief, pp. 55–57; reply brief, pp. 25–28) This argument overlooks the fact that all of these considerations with respect to industry trends were recognized and discussed in the greatest detail by the Commission in its *Phillips* decision (Op. 338, pp. 559-560), and constituted the basis for the Commission's refusal to adopt a sales realization method. The Commission there concluded, in this connection:

> Because of the industry tendencies that have developed, we deem it appropriate that in allocating the joint exploratory costs and development losses of Phillips, we shall give increased consideration to the Btu's in gas as a fuel as compared with oil and not confine ourselves entirely to a relationship based solely on recent historical relative values or relative production costs. (Op. 338, p. 560)

Finally in approving and adopting its economic factor of four, the Commission stated:

> The ratio we adopt to allocate Phillips' exploration costs thus gives more consideration to the relative Btu contents than does the relative test year realizations, or relative production costs, gives effect to the upward trend of gas production relative to oil in relation to the present level of exploration costs, and recognizes the increasing contribution that Phillips' current exploration costs are making to gas supplies as compared with oil. We believe that using such a ratio, and also fixing all gas rates on the basis of costs thus obtained will be of great benefit to consumers and producers alike. (Op. 338, p. 561)

Under these circumstances, the point here raised by Tidewater does not appear to be relevant, since the conditions stressed by Tidewater are already accounted for and reflected under the Commission's modified Btu method.

In view of the above, it is here concluded that Tidewater's exploration costs should be allocated between liquids and gas under the modified Btu method

[28] In addition, the argument seems particularly meaningless when it is recognized that the exploration costs which we are attempting to allocate here consist mainly of the costs of *unsuccessful* exploration.

approved by the Commission in *Phillips*. A question is presented, however, as to whether the *Phillips*-approved economic factor of four is the appropriate factor for use in the instant Tidewater proceeding.

In developing its economic factor of four in the *Phillips* case the Commission started out by noting that the ratio of the Btu content of a standard measure of gas (an Mcf) to the Btu content of a standard measure of oil (a barrel) is about 1 to 6. (Op. 338, p. 560) However, the Commission then noted that on the basis of Phillips' own prices in the field its ratio of the price of a barrel of petroleum to an Mcf of gas at the wellhead ranged from a ratio of 39 to 1 in 1952, 33 to 1 in the test year 1954, down to about 29 to 1 in 1956; that if this trend were extended, the *Phillips* price ratio would have reached 24 to 1 in 1958. The Commission further noted that on a nation-wide basis the same ratio was 32.5 to 1 in 1952 and 27 to 1 in 1954; that, on the basis of figures published by the Bureau of Mines, this trend, with certain ups and downs, had continued, reaching 25.3 to 1 in 1958; that this nation-wide trend, if extended, would have reached a ratio of around 23 to 1 in 1959. (Op. 338, p. 561) After considering this data, the Commission concluded that a price ratio of 24 to 1 should be reflected in arriving at the desired economic adjustment factor. The Commission then concluded:

> Upon the basis of the considerations expressed above, and the record in this proceeding, we are of the opinion that the proper economic factor to be applied to the straight Btu content of oil to allocate Phillips' test year exploration costs is four, so that the cost relationship of finding one Mcf of gas to one barrel of oil will be about one to 24. (Op. 338, p. 560)

In determining the economic adjustment factor to be applied in the instant proceeding, it would seem reasonable to consider and reflect the most recent price ratio data which is available. On the basis of figures published in the most recent Bureau of Mines Mineral Yearbook, it appears that the *actual* nation-wide price ratio was 22.5 to 1 for the year 1959.[29] Using the Bureau of Mines nation-wide price ratios for each year from 1952 to 1959, a trend can be plotted which would indicate an expected price ratio of approximately 22.2 in 1960 and 21.1 in 1961.[30] Although it would be of interest in this connection to determine the Tidewater price ratios for recent years on the basis of its own prices in the field, it is not possible on the instant record to determine any Tidewater price ratios beyond the test year 1957. A rough calculation would indicate that Tidewater's actual price ratio for that year was 21.64 to 1.[31]

In view of the fact that the nation-wide price ratio was down to 22.5 to 1 in 1959 and since it can be estimated that if this trend were continued the nation-wide price ratio would have reached 22.2 for 1960 and 21.1 for 1961, there might be a reasonable basis for contending that a somewhat lower economic adjustment factor should be used in the instant proceeding than the factor of four which the Commission adopted in *Phillips*. In no event, however, would it be possible on the basis of the most recent data available in this proceeding to justify an economic adjustment factor which would

---

[29] The actual ratio was thus slightly lower than the 23 to 1 ratio which the Commission estimated for the year 1959 in Op. 338.

[30] Although the Bureau of Mines data was not made a part of the record in the instant proceeding, it is considered appropriate to take administrative notice of such data, as the Commission did in Op. 338.

[31] Based on Tidewater's 1957 crude oil unit realization of $3.138 per barrel (Exh. 150, Sched. 8, Footnote 2); and using the price of 14.5 cents per Mcf for gas, which is described in intervenors' initial brief (p. 32) as Tidewater's average revenue for gas sold under rate schedules in effect during the 1957 test year (derived from Tidewater's 1957 Form 301).

reflect anything lower than an 18 to 1 price ratio, which would provide the basis for an economic adjustment factor of 3. In view of the facts as outlined above, it seems clear that an adjustment factor of 3 would be on the low side and would give the benefit of all doubts to Tidewater in this connection. Under all the circumstances described above, and in view of the meager experience which the Commission has had thus far in deriving a proper Btu adjustment factor in such situations, it is concluded that an adjustment factor of three should be applied to the straight Btu content of the Tidewater liquid production, in applying the Commission's *Phillips* modified Btu method in this proceeding.

Intervenors' application of the *Phillips* modified Btu method to Tidewater's exploration costs in this proceeding is set forth in Appendix A, Table 2, of intervenors' initial brief. Tidewater contends that the intervenors erred in their application of the Btu economic adjustment factor in this computation, in that they applied the adjustment factor to the Btu content of *all* liquids produced by Tidewater—including the Btu content of liquids extracted in gas processing plants. It is pointed out, correctly, that this represents a departure from *Phillips*, where the economic adjustment factor was applied only to the Btu content of liquids produced and separated on the lease. The Commission concluded in *Phillips* that the allocation of wet gas stream costs between natural gas and extracted liquids should be made under the straight Btu method, and that in this particular step it would not be necessary to bring in the factor of market price as was done in connection with exploration costs. (Op. 338, p. 563)

The problem arises here because in Tidewater's application of the straight Btu method for its allocation of both production and exploration costs between liquids and natural gas, extracted liquids were included in the total liquids category. (Exh. 129, Sched. 5; Appendix 3 to Tidewater initial brief, Sched 2, p. 6) The net result was that Tidewater's distribution of wet gas stream costs between extracted liquids and residue gas occurred in the same step as its general allocation of all costs between total liquids and gas. Since both intervenors and Staff simply adopted these Tidewater figures, the net effect of applying the Btu adjustment factor to the Tidewater total liquids figure was to simultaneously adjust the Btu content of the extracted liquids as well.

It is concluded that in order to apply the adjustment factor in a manner consistent with the Commission's treatment of this matter in *Phillips*, a modification must be made in intervenors' application of the modified Btu method in Appendix A, Table 2 of its initial brief. This has been accomplished, as shown on Appendix A, Table 3 of the instant decision, by separating out the plant liquids from the total "liquids sales" figure shown in the intervenors' computation, and by then applying no adjustment factor at all to such plant liquids figure.

Pursuant to the conclusions reached above, the allocation of exploration and development costs under the modified Btu method is here accomplished (Appendix A, Table 3 of this decision) by using the computation in Appendix A, Table 2 of intervenors' initial brief as a point of departure, and by making two modifications therein: 1) the substitution of an economic adjustment factor of three, in place of the *Phillips* factor of four; 2) application of this adjustment factor solely to the Btu content of liquids produced and separated on the lease. The result is to produce an allocation ratio of 24.17% for gas under the modified Btu method, which is here adopted.

It is of interest to note here that intervenors' cost of service studies, Exh. 150 and 180, employed a reserves added realization method (RAR) for

their allocation of exploration costs—this method being roughly the same as the RAR method which the same intervenor group presented in the *Phillips* case, and which was there rejected by the Commission in Op. 338. The Tidewater briefs contain an extended discussion attacking the RAR allocation method, and arguing that there were in any event serious deficiencies in the manner in which it was applied in the instant proceeding.

In view of the fact that this method was rejected by the Commission in *Phillips*, no purpose would be served here by discussing intervenors' RAR method or the Tidewater objections thereto. It is of interest to note, however, that intervenors under the RAR method arrived at an allocation ratio for gas of 27.42%, which is somewhat higher than the 24.17% allocation ratio here approved under the modified Btu method.

In concluding this discussion with respect to the allocation of exploration and development costs, it is of interest to note that in spite of all the complexities which have surrounded this problem in both the *Phillips* case and the instant Tidewater proceeding, the entire question in the last analysis resolves itself down to a very simple and basic choice between two conflicting alternatives:

(1) whether to allocate exploration costs between liquids and gas under the straight Btu method, which does not in any way measure or reflect the relative values of the two products—this being a method which in the *Phillips* case would have resulted in the allocation of 61.88% of exploration costs to gas;

(2) or whether to adopt a method which *does* measure and reflect the relative values of the two products. In the *Phillips* case a number of different types of allocation methods reflecting relative values were proposed, ranging in result from the RAR method which allocated 30.46% to gas, to a low of 20.82% under a sales realization method.

The Commission in *Phillips* adopted the modified Btu method, with an economic adjustment factor of four based upon relative values—producing an allocation of 32.742% to gas. This represented only 52.9% of the ratio allocated to gas under the straight Btu method.

It is interesting to note that in the instant proceeding Tidewater's straight Btu method would allocate 49.31% of exploration and development costs to gas. By contrast, the method here approved, consisting of a modified Btu allocation with an economic adjustment factor of three, allocates 24.17% to gas—representing 49.77% of the ratio allocated to gas under the straight Btu method.

Kahn's 14,500,000 Mcf Volume Adjustment

Intervenor witness Kahn concluded that Tidewater's 1957 test year gas production was abnormally low and out-of-line with its potential productive capacity. In order, therefore, to match test year gas production with potential productive capacity he concluded that Tidewater's 1957 gas production figures should be normalized by increasing actual gas sales volumes by 14,500,000 Mcf (from 95.2 million Mcf to 109.7 million Mcf)—prior to determining Mcf unit costs for development dry holes, exploration expense, and return on gas rate base. (Exh. 150, Sched. 15)

Kahn supported this adjustment on the following grounds:

(1) There was a very much higher concentration of developmental dry hole expense in the Southern and Central Divisions in 1957 than in 1955 on essentially gas-producing properties—amounting to more than a fourfold increase. At the same time gas sales for the entire Southern and Central Divisions went

up only approximately 12½ per cent, and the increase in sales from gas-condensate leases alone amounted only to roughly 20 per cent during this two-year interval. (45:6810-11)

(2) Exploratory expenses of the Southern and Central Divisions were approximately 50 per cent higher in 1957 than in 1955. Exploratory expenses allocated to gas (under Kahn's RAR method) rose 64.5 percent during this period. (45:6811-12)

(3) In the years 1950-1952, gas wells accounted for between 4.66 and 6.75 per cent of the total net productive wells drilled by Tidewater. In 1953-1956 the ratio fluctuated within a narrow range of 10.24 and 12.78 per cent. However, in 1957 gas wells suddenly jumped to 17.05 per cent of the total. This Tidewater ratio of gas wells to total productive wells drilled substantially exceeded the industry average. (45:6815-16)

On the basis of this data Kahn concluded that Tidewater in 1957 had greatly increased the relative emphasis of its operations on gas. He further concluded that Tidewater's additional expenditures in 1957 did in fact produce a proportionately larger physical production capacity than was reflected in sales during that year. This conclusion was based upon the following:

(1) He examined the ratios between the end-of-year reserves and annual production of natural gas by the Southern and Central Divisions for 1957 and the five years preceding, and for the entire company in 1957 and 1958. These figures were as follows:

Year	*Life Index*
Southern and Central Divisions:	
1952	27.25
1953	25.71
1954	27.26
1955	27.36
1956	23.62
5 year average	26.24
1957	30.16
Entire Company:	
1957	29.30
1958 [1]	27.03

(45:6812-13)

[1] Kahn explained that he had used "entire company" figures for 1958 because he did not have data limited to the Southern and Central Divisions for that particular year. However, he concluded that this did not present a serious problem, because

> . . . I did make a comparison of the year by year changes in the production of the company and in the reserves of the company with those of the southern and central division, that is, in the preceding years for which I had data for both, and found a very, very close correlation. (52:7372)

These figures demonstrated that in none of the five years preceding 1957 was the Tidewater life index anywhere near the level reached in that later year. The life index in 1957 was in fact almost four years higher than the average for the preceding five years. Kahn concluded that this evidence provided a very clear indication that the greatly increased developmental and exploratory expenses for the test year 1957 did in fact leave the Southern and Central Divisions at the end of that year with a production capacity that would in terms of the company's experience in the preceding five years, have supported a considerably higher level of output in that year. He further concluded from the above data that the 1957 situation was obviously temporary, noting that in 1958 production moved up again to a substantial degree, dropping the life index by 2.27 years.

As a further indication that the increase in output of gas in 1957 was unusually low compared with the increase in reserves, Kahn considered the year-by-year increases, in both percentage and absolute terms, in production and proved reserves of natural gas in the Southern and Central Divisions

for the period 1952-1957, and for the entire company in 1958. This data showed the following:

Increases over the preceding year

Year	Production		Proved reserves	
	Million Mcf	Percent	Million Mcf	Percent
Southern and Central Divisions:				
1952	11	25.0	139	10.2
1953	7	12.7	95	6.3
1954	11	17.7	396	24.8
1955	13	17.8	363	18.2
1956	11	12.8	62	2.6
1957	6	6.2	852	36.0
Entire Company:				
1958	16	15.6	204	6.7

(45:6814-15)

He concluded that the extraordinary and abnormal character of Tidewater's 1957 experience was demonstrated by the extraordinarily large increase in reserves of gas on both an absolute and on a percentage basis, and by the extraordinarily small increase in production which followed.

As still further evidence that Tidewater had in being at the end of 1957 capacity capable of a higher level of production than was in fact demonstrated in that year, Kahn noted that although the company's allocated end-of-year gas rate base increased by 90 percent between 1955 and 1957, this was accompanied by only a 12.5 percent increase in the production of natural gas. (45:6817-18)

Finally, he pointed to the fact that in 1955, 35 percent of the net investment in the gas-condensate category was accounted for by non-producing leases, whereas in 1957 this ratio had risen to 51 percent. By contrast, in the crude-casinghead gas category only 2.2 percent of total net investment was accounted for by non-producing leases. (45:6818)

Kahn further concluded that the unusual character of this Tidewater experience for 1957 was not reflected in similar behaviour in the industry at large. He noted that in the years 1950-1952 gas wells accounted for between 4.66 and 6.75 percent of the total net productive wells drilled by Tidewater; that in the period 1953-1956 the ratio fluctuated within a narrow range of 10.24 and 12.78 percent; but that in 1957 gas wells suddenly jumped to 17.05 percent of the total. This substantial Tidewater increase in 1957 reflected a much higher rise than the industry average. (45:6815)

As a final comparison, he noted that in the 1951-1956 period the gross additions to the Tidewater Southern and Central Division reserves of gas averaged 9.52 Mcf per barrel of comparable gross findings of crude oil; whereas in 1957 the ratio shot up to 18.46 Mcf per barrel. By contrast, for the industry as a whole the 1951-1956 average was 5.60 Mcf per barrel, with ratios ranging from 3.64 Mcf per barrel in the former year to 8.36 in the latter year, while the 1957 industry-wide figure remained stable at 8.30 Mcf per barrel. A similar comparison of 1958 and 1957 data for the company as a whole demonstrated further that 1957 represented an unusual year. Gross findings for the entire company were 15.25 Mcf per barrel of oil in 1957 and dropped back to 6.53 Mcf in 1958. By contrast, for the country as a whole the ratios remain fairly stable at 8.30 and 7.29 in those two years. (45:6816)

On the basis of the data set forth above, Kahn concluded that Tidewater in 1957 had greatly increased the relative emphasis of its operations on gas—compared both with preceding years and with the years that followed, and

with the industry at large. He further concluded that Tidewater at the end of the year 1957 had "in being" a capacity capable of a much higher level of production than was in fact demonstrated in that year. He accordingly concluded that an upward normalization of the volumes of gas actually produced in the test year 1957 was necessary in order "to get 1957 back on a basis comparable with other years." (45: 6823); and that such a nomalized adjustment was a prerequisite to the use of 1957 as a test year for the purpose of fixing rates in the instant proceeding.

He further concluded that a reasonable procedure for making such a normalizing adjustment would be to normalize the 1957 sales of the Southern and Central Divisions upward by the amount required to produce the same life index as the five-year average of 26.24 for the preceding five years. Using this formula, he derived a normalizing gas volume adjustment in the amount of 14,500,000 Mcf.

Kahn stressed that the purpose of his normalizing adjustment was not to remove non-producing properties from the rate base; that rather its purpose was to prevent a double earning of the approved rate of return—first, by deriving a relatively high rate through the process of dividing the total dollars required by the temporarily low 1957 production level; second, through the greatly increased sales which were ready to be made by Tidewater by the end of 1957.

Kahn did not recommend that Tidewater's total cost of service should be divided by the normalized production figure. He recognized that the higher production level attained in 1958 must have been accompanied by higher expenses of certain types—for example, depreciation and depletion. He accordingly proposed that the normalized production figure should be used as the denominator in computing the per Mcf cost only in the case of those elements in the total cost of service which created the capacity and which would not in themselves require an increased expenditure in order to bring about actual production up to the production capacity which they had created. These elements constituted developmental dry hole losses, exploratory expenses, and the return on investment.

In evaluating the merits of the intervenors' proposed 14,500,000 Mcf volume adjustment it is recognized that Tidewater's costs have actually shown a rising trend, and it is for this reason that the year 1957 is here adopted as the test year. However, it is important to note that this higher level of costs in 1957 to a significant degree results from and reflects an expansion by Tidewater in its exploration and developmental operations for that year, as compared with its 1955 operations. Under these circumstances, if the year 1957 is to be appropriately acceptable as a test year, it becomes important to determine whether the production of gas in that year reflected the mentioned expansion to a degree which can be regarded as normal and representative for the Tidewater system. The data presented by intervenor witness Kahn, referred to above, clearly indicates that this was definitely not the case in the year 1957, but rather that the 1957 relationship between the expanded exploration operations and the actual production and sales of jurisdictional gas was seriously unrepresentative and out-of-line with what could be expected normally for the Tidewater system.

Under such circumstances, it is concluded that it would be clearly improper in this case to use the 1957 test-year cost of service without applying an appropriate and reasonable normalizing adjustment to Tidewater's 1957 actual jurisdictional gas production volumes. The failure to make any such normalizing adjustment would be particularly unfair in view of the fact (which will be

developed at a later point) that a 1957 *year-end* rate base is here being adopted rather than an average 1957 rate base.

The Staff's initial brief (p. 16) concludes that no such adjustment should be made in this proceeding, on the ground that it is "infected with the hazards of prediction, being based on prior years' experience". The Staff nevertheless concedes that the failure to make any such adjustment would produce an unsatisfactory result, stating:

> Nevertheless, it does appear that the 1957 exploration costs are excessive when applied wholly against unexpanded Tidewater gas production in 1957. (initial brief, p. 16)

It is concluded that the circumstances outlined above far outweigh the negative considerations advanced by the Staff and by Tidewater. It is significant that Tidewater did not at any point, either during its extremely lengthy cross-examination of Kahn with respect to this problem or in its briefs, raise any question whatsoever as to the validity of the data relied on by Kahn in support of this proposed adjustment. Instead, during his lengthy cross-examination of Kahn on this subject (52:7331-7390) Tidewater counsel raised and explored with Kahn a number of suggested possible fallacies in the rationale for his adjustment, in the use which he made of the data, and in the conclusions which he drew therefrom. An examination of this portion of the transcript indicates that Kahn effectively disposed of all of these problems.

In the course of its attack upon Kahn's instant volume adjustment, Tidewater contends that under normal and customary operating conditions producers commonly build up exploration operations and productive capacity in excess of actual production, which does not reach its full potential until some later date; that this lag between exploration operations and actual production and sale is perfectly normal (citing the Commission's discussion in *Phillips*, at pages 550 and 565); and that the approval of the instant proposed adjustment would discourage producers from investing greater sums in exploratory efforts. It is concluded, however, that by virtue of allowing Tidewater a return on year-end rate base the company is here given the benefit of that lag. However, if this maximum end-of-year investment is matched against a volume of annual production which is abnormally low and out-of-line, the result is to reflect a lag which goes far beyond the normal, representative operating situation. In here adopting the intervenors' 14,000,000 Mcf gas volume adjustment the purpose is merely to restore the picture to one reflecting a *normal representative lag*.

Allocation of Production Costs Between Residue Gas and Liquids Extracted from the Wet Gas Stream

In the *Phillips* case the Commission applied its relative cost allocation only to those liquids separated on the lease, and used the straight Btu method for the allocation of wet gas stream costs in a final and separate step between residue gas and extracted liquids.

In the instant proceeding, however, Tidewater did not make the allocation of wet gas stream costs between extracted liquids and residue gas in a separate step. Instead, in applying the straight Btu method for its allocation of production and exploration costs between the two categories of total liquids and gas, Tidewater included extracted liquids in the total liquids category (Exh. 129, Sched. 5). The net result was that Tidewater's distribution of wet gas stream costs between extracted liquids and residue gas occurred in the same step as its general allocation of all costs between total liquids and gas.

The Staff and the intervenors followed the same short-hand, one-step method However, since Staff and intervenors employed the relative cost method, rather than the Btu method, for their allocation of joint production costs, the net effect was that joint production costs were thereby allocated to extracted liquids under the relative cost method. At pp. 13-14 of its reply brief Tidewater criticizes this procedure as being a departure from the Commission method in Op. 338. It contends that the intervenors' application of the relative cost method to all liquids whether separated on the lease or at the processing plant results in an unrealistic shift of costs to liquids as demonstrated by the following comparison:

	Production and Exploration Cost per Barrel of Liquid Extracted From Wet Gas Stream Including 11% Return
"The Commission in *Phillips*	$ .4295
Tidewater's Application of Phillips (Initial Brief)	.4759
Intervenors' Application of Phillips (Initial Brief):	
Exhibit 150 method	2.627
Exhibit 180 method	2.651 "
(reply brief, p. 14)	

Unfortunately, the Tidewater brief does not indicate where these figures were obtained or how they were derived. It is important to bear in mind, however, that the comparatively low cost thus calculated by Tidewater for extracted liquids under its application of *Phillips* procedures reflects not only Tidewater's use of the separate-step Btu method for the allocation of wet gas stream costs, but also reflects its purported application of "Phillips procedures" in certain other aspects which have here been rejected—for example, its use of the *Omnibus* imputed factors in applying the relative cost allocation method.

It should also be noted that no issue was raised at any time throughout the lengthy Tidewater proceeding with respect to the proper method for handling the allocation of costs to the extracted liquids. Tidewater was aware throughout the hearing that Staff and intervenors had followed the Tidewater lead in using the short-hand one-step method for this purpose, and that this resulted in intervenors' applying their over-all relative cost allocation method to the extracted liquids, as well as to the liquids separated on the lease.

In addition, it is concluded that even if the allocation to extracted liquids were made in a separate step under the *Phillips* approach, with all other components of the cost-of-service being derived under the methods herein approved, the difference in results would not be sufficiently significant to warrant reopening this matter at this late stage. Under these circumstances, it is concluded that the objection here raised by Tidewater, which was made for the very first time in a direct and unequivocal manner in its reply brief, is not entitled to further serious consideration.

Gasoline Plant Costs

Although Tidewater included gasoline plant return and expenses in its total cost-of-service for liquids and gas (Exh. 129, Sched. 2, lines 4 and 10) it did not allocate any such gasoline plant costs to gas in its proposed cost-of-service. As pointed out by the Staff (initial brief, p. 9), Tidewater had originally assigned some of its gasoline plant costs to producing leases on its basic book accounts. The net result was that a portion of such gasoline plant costs was ultimately assigned to gas under the intervenors' relative cost allocation of production costs between liquids and gas.

Since the record does not show what portion of gasoline plant cost was assigned on Tidewater's books to "producing leases" accounts, or the method by which such assignment was made, it is not possible to determine whether this Tidewater technique accounted for all gasoline plant costs which properly should be chargeable to gas. Under these circumstances, it seems fair to simply follow Tidewater's own approach, under which there is not allocated to gas any of the costs remaining in the "gasoline and cycling" plant account.[22]

Accordingly, gasoline plant costs have been omitted in Appendix A, Tables 2 and 5 at the end of this decision, which deal with the allocation of off-lease expenses and off-lease net investment between liquids and gas.

Rate Base

In *Phillips* case the Commission used a year-end rate base for the test year, rather than an average rate base. It noted that Phillips' investment had been steadily increasing "presumably, in part, because of the increasing costs of drilling for gas". The Commission then held:

> In a company with such a rapidly expanding need for investment, we are of the opinion that the average test year rate base is not as representative of succeeding years as the year-end test year rate base, and therefore we agree with the examiner that year-end should be used. (Op. 338, p. 565)

Tidewater contends that similar considerations require the use of a year-end rate base in the instant proceeding. Although intervenor witness Kahn used an average rate base in his cost studies, he indicated during cross-examination that he did not wish to take any position on this particular question in connection with the problem of fixing rates for the future. Furthermore intervenors' initial brief, in applying to the facts of this case the allocation procedures adopted by the Commission in *Phillips*, employed a year-end rate base in place of Kahn's average rate base.

It is concluded that year-end rate base should be used here, for the same considerations which were determinative in *Phillips*.

Working Capital Allowance

Under the traditional method employed in rate proceedings involving electric companies and pipeline companies, the Commission grants an allowance for working capital which includes (1) an appropriate allowance for materials and supplies, and (2) an allowance for cash requirements representing one-eighth of annual operating expenses, or 45 days' expenses.

In *Phillips* the Commission adopted the same method in computing the working capital allowance, stating that it saw no reason why the traditional method should not also be applied for the independent producers. (Op. 338, p. 566) Tidewater, however, has employed a different technique in this proceeding, using a balance-sheet cash figure as its working capital allowance for cash requirements (Exh. 128, Sched. 2, p. 13) and allocating this amount among gasoline plant, royalties, and leases (Exh. 128, Sched. 2, p. 10). Intervenors have simply adopted this Tidewater method, without comment. (Exh. 150, Sched. 13).

It is concluded that the working capital allowance should here be derived in the traditional manner as adopted by the Commission in *Phillips*, and as employed by the Staff in Appendices A and B to its initial brief. The amount allowed for cash requirements, shown on Appendix A, Table 5 of this

[22] It is relevant to note here that this matter was similarly handled in the *Phillips* case, where Phillips "charged the investment and operating costs of the gasoline plants wholly to the liquids." (Op. 338, p. 563)

decision, is adopted from Appendix E to Staff's initial brief. The Staff allocated this allowance between liquids and gas under its general approach for the relative cost allocation of indirect investment, applying the same factor which it derived for direct investment. Since, as earlier pointed out, the intervenors' average composite ratio method has instead been adopted for the allocation of indirect investment, the working capital allowance is here allocated between liquids and gas pursuant to that method, as shown in Appendix A, Table 6 of this decision.

Rate of Return and Federal Income Tax Allowance

It is conceded that Tidewater actually incurred no income tax liability in the test year 1957 (Tidewater reply brief, p. 29). Indeed, it had a negative tax, or a tax credit in 1957 which was due, among other things, to "accelerated exploration and development activities". (Staff initial brief, p. 20)

However, Tidewater takes the position that it is entitled to a return on its investment which will compensate it for the risks inherent in its natural gas operations and provide a substantial increment of incentive for exploration and development plus compensation for the wasting assets and that

> Whether this requisite return is provided by an allowance stated as rate of return or a rate of return, plus statutory tax benefits, is immaterial to Tidewater. What is important to Tidewater is the compensation it receives for its natural gas, and not how this compensation is calculated. (initial brief, p. 81)

Consistent with this philosophy, Tidewater states that it

> relies on the testimony of Dr. Ralph E. Badger who recommended a 25% rate of return including actual Federal income tax or its equivalent of a 12% rate of return and Federal income tax computed without regard to statutory depletion and the expensing of intangible drilling costs. (initial brief, p. 67)

Tidewater states this another way in its reply brief, as follows:

> The retention of tax benefits is the *sine qua non* and the complement of an exclusive reliance of earnings price ratios. When the tax benefits are added to an earnings-price-ratio-determined return, the sum of the two does no more than meet the capital attraction test. (p. 30)

This entire Tidewater position is, of course, strongly reminiscent of the rate of return position taken by Phillips Petroleum Company in the *Phillips* proceeding. Phillips there contended that it should be allowed a 12% rate of return, plus the allowance of phantom taxes; or that, in the alternative, it should be allowed a 17-18% rate of return, plus actual taxes. The Commission, however, allowed Phillips an 11% rate of return, plus *actual* taxes—and did not treat the use of earnings-price ratios in its rate of return determination as being in any way dependent upon the allowance of the benefit of "phantom taxes" to the producer.

Tidewater relies upon the recent decision of the Court of Appeals in *El Paso Natural Gas Company* v. *F.P.C.*, 281 F. 2d 567 (CCA 5, 1960) as supporting its general position on this subject. It contends that in that decision

> . . . the court stated that the Examiner and the Commission may look to the tax benefits relating to statutory depletion and the expensing of intangible drilling costs as a measure of the incentive necessary to attract capital for exploration and development, as well as a measure of the allowance needed to cover the depletion of the wasting asset. (initial brief, pp. 76–77)

Apparently on the basis of this interpretation, Tidewater contends that the Commission's addition in the *Phillips* case (Op. 338) of a 2% increment to the 10% factor derived from earnings-price ratios, did *not* provide the required "strong incentive for exploration and development." (reply brief, p. 39)

However, it seems inescapably clear from a reading of the *El Paso* decision that the Court held just the reverse, as follows:

(1) The Court held that only *actual tax liability* may be allowed as the income tax component of the cost of service.

> The requirement that the Commission determine a just and reasonable rate is not modified by reading into the statute an exception to the extent that the prices charged may be sufficient to afford a just and reasonable rate *plus* an amount representing a savings in taxes granted to the gas industry. (281 F. 2d 572)
>
> * * * * * * *
>
> . . . whatever federal income taxes were actually paid for the test year should be treated as part of the cost of service regardless of whether these taxes were less than would have been paid but for the depletion allowance and the deduction for intangible drilling expense. No theoretical amount not actually paid can be so included. (281 F. 2d 573)

(2) The Court recognized that the rate of return must include an increment for incentive, but held flatly that this may not be accomplished by merely treating the tax savings as the amount necessary to provide for return and incentive; that instead the necessary increment for incentive, to be included in the return, must be determined on the basis of an inquiry directed to that precise issue accompanied by findings on the amount *actually necessary* to provide such incentive.

> It is the duty of the Commission to fix a rate that represents the cost of service and a reasonable return on the investment, including compensation for consumption of the gas and an increment for incentive, instead of merely *treating* the tax savings as the amount necessary to provide for return and incentive. This can be done only by making the necessary inquiry directed to this issue, building up a proper record, and making findings on the amount *actually necessary* to provide these items. (281 F. 2d 573)

It seems clear that the Tidewater position on this entire subject has now been rendered completely obsolete and untenable by the Commission's *Phillips* decision, and by the Court of Appeals decision in the *El Paso* case, *supra*. That position must finally be rejected in view of the Commission's recent decision in the *Panhandle Eastern* case, Op. 344 (April 27, 1961) 25 FPC 787 where the Commission discussed the holding of the Court of Appeals in the *El Paso* case, and then stated:

> In view of this authority, we are of the opinion that we should allow Panhandle only taxes payable as a result of the statutory depletion and the intangibles. The tax allowances should be computed utilizing these permissible deductions, *and rate of return should be treated as a separate question.* (p. 797, emphasis supplied)

It is accordingly clear that Tidewater is not entitled to any allowance for Federal income taxes in its instant cost of service.

The position of the other parties with respect to the rate of return issue is as follows:

(1) Intervenors do not make any specific recommendation as to a precise rate of return level. However, in their cost of service computed under the *Phillips* approach (Appendix A, initial brief) intervenors use the same 11 per cent rate of return which the Commission adopted for Phillips in Op. 338.

(2) The Staff contends that the over-all rate of return for Tidewater should be no more than 9 percent, reflecting an allowance of 13.2 per cent on equity. (initial brief, p. 20)

Since the Staff's rate of return approach is being adopted here, with some modification, consideration will now be given to the various factors which were used and considered by Staff in deriving its recommended rate of return.

Earnings-Price Ratios

The Staff noted that the earnings-price ratios of 39 integrated and unintegrated gas producers averaged 7.44 percent during the five-year period 1953-1957. (Item S, p. 13) [23] This 39-company group included 15 Class A producers (companies engaged solely in producing operations, producing gas and oil), 3 Class B producers (producers of gas and oil and refiners), 20 Class C integrated producers (producers of gas and oil, refiners and marketers), and one Class D producer (producer of gas and oil engaged in marketing but not refining). It represents the identical group of producers whose earnings-price ratio data and average earnings on equity data were used by the Commission in its consideration of the rate of return question in Op. 340, *United Carbon Company and Columbian Fuel Corporation*, 25 FPC 181, (p. 186). The Staff also noted that during the same period Tidewater's own earnings-price ratios averaged 10.48 percent. The Staff actually used the higher Tidewater earnings-price ratio of 10.48 percent, adding to it an additional .75 percent for cost of financing, and an additional 1.95 percent as an adjustment to the "bare bones" cost of equity, to bring Tidewater's stock price up to 1.40 percent of book value, producing an adjusted earnings-price ratio of 13.18 percent.

Tidewater takes the position (reply brief, pp. 32-36) that earnings-price ratios are not a measure of the cost of capital to gas producers and therefore may not be used or considered in any way. In its attack upon the use of earnings-price ratios, Tidewater argues that earnings-price ratios are a measure of the cost of common stock only when two conditions are met—(1) that stocks are bought by investors primarily for their income producing capacity, and (2) that past and current earnings do not significantly diverge from expected future earnings. Tidewater contends that prices of producer stocks do not reflect either of these conditions; that stock prices of producers are influenced by the market values of what investors assume or guess to be the underlying reserves of oil and gas; that as a result speculative activity characterizes the trading in common stock of producers, and the price behavior is volatile and erratic; that investors purchasing common stocks of an oil and gas producer are not discounting current earnings, but are trying to evaluate earnings three to five years in the future; that producer stocks are not bought for current income but for future growth in income and capital gains; that in numerous instances the prices of producer stocks increased despite a slump of earnings, and vice versa; that any averaging of such erratic data cannot give any rational results and would constitute an unreasonable interpretation of investor behavior.

These Tidewater criticisms of the use of earnings-price ratios are similar to the attacks on earnings-price ratios which were made in the *Phillips* case.

[23] The said Item S represented Staff's rate of return exhibit, Exhibit 23, in the *Murphy Corporation* case, G-9548 *et al.* (25 FPC 334).

They were fully considered by the Commission in Op. 338, and the Commission there stated:

> In past proceedings dealing with the rates of both electric utilities and natural gas pipeline companies we have always considered a number of factors in arriving at a proper allowance for common equity and finally a rate of return. In doing so, we have paid considerable attention to the earnings-price ratio of the company involved and other companies similarly situated. The advantage of the earnings-price ratio as a critique is that it shows what investors will pay for the securities of the company involved in relation to contemporary earnings. But earnings-price ratios have pronounced drawbacks in some proceedings, including this one. Investors are interested in contemporary earnings, but they may be interested in other things as well, such as future earnings, possible discovery of large reserves, tax advantages, a hedge against inflation, so that the market price may reflect factors other than earnings. This is apparently true here, for the record shows that while the earnings on the book value of independent producers' equity have declined somewhat from 1949 through 1955, market prices of their stock have risen substantially. Furthermore, it is plain that potential investors in Phillips are not greatly influenced by Phillips' position in the gas business, since but six percent of its gross income comes from this source. While as we said in the *Southern Natural* case the study of earnings-price ratios over a period of years may properly be used with judgment, together with other factors, in determining a reasonable allowance for equity, this is not a case where earnings-price ratios should be a controlling factor in arriving at a fair rate of return.

The Commission in Op. 338 thereupon turned its attention to earnings-price ratios, earnings to book value ratios, and allowances for common equity granted by the Commission in previous proceedings to pipeline or electric companies. After considering all of these factors the Commission added an additional 2 percent incentive allowance on top of the allowance of 10 percent for equity, *derived under the earnings-price ratio method*, producing an allowance for common equity of 12 percent, which it approved for Phillips.

Subsequently, in another producer rate case, Op. 340, *United Carbon Company and Columbian Fuel Corporation*, the Commission again considered the criticisms against the earnings-price ratio method, and concluded that "earnings-price ratios over a period of years may properly be used with judgment, together with other factors, in determining a reasonable allowance for equity", but that "such other factors must be given considerable weight in determining the rates of return of independent producers." (Op. 340, p. 186) The Commission arrived at this conclusion after the following analysis:

> In past proceedings dealing with the rates of both electric utilities and natural gas pipeline companies, as stated in our *Phillips* opinion, we have always considered a number of factors in arriving at a proper allowance for common equity and finally a rate of return and in doing so we have given some weight with judgment to the earnings-price ratio of the company involved and other companies similarly situated. The advantage of the earnings-price ratio is that it shows what investors will pay for the securities of the company in relation to contemporary earnings. However, investors are frequently moved by other considerations than contemporary earnings; they may be interested in future earnings, possible discovery of large reserves, tax advantages, a hedge against inflation, so that the relationship between earnings and price is not always a complete criterion. This is true of the producers, for the record shows that between 1950

> and 1957 producer earnings on the book value of their shares remained constant or trended downward while market prices increased substantially.

After laying down this *caveat*, the Commission stated: "We think as did the examiner, that the earnings price ratio of 39 companies engaged in the oil and gas producing business is significant. For the 1953-1957 period, the average earnings-price ratio for these companies was 7.4 percent." (p. 186)

In view of these holdings by the Commission in both Op. 338 and Op. 340, it is clear that the Tidewater position with respect to the use of earnings-price ratios must be rejected; that instead earnings-price ratio data may properly be used in this proceeding "with judgment", although it is not to be treated as a "controlling factor".

It is of interest to note that Staff's use in the instant proceeding of the earnings-price ratio data *for its 39-company group of integrated and unintegrated gas producers* has already been directly approved by the Commission in Op. 340, where the Commission characterized the earnings-price ratio data for these companies as "significant" for the purpose of its rate of return analysis. (Op. 340, p. 186) It should also be noted that Staff's use of the time period 1953-1957 in its consideration of earnings-price ratio data has also been directly approved by the Commission in Op. 340, where the Commission accepted and relied upon the identical earnings-price ratio data as presented by the Staff for the same five-year 1953-57 period. Similarly, in the *Phillips* case (Op. 338), the Commission rejected Phillips' attempt to use a 9-year period, 1947-55, for the derivation of an earnings-price ratio, stating:

> We agree with the examiner that the appropriate period was the five years, 1951 to 1955, because that reflects the more recent trend of earnings-price ratios. (Op. 338, p. 571)

In addition to its general attack upon the use of earnings-price ratios, outlined above, Tidewater attacks the method used by the Staff to compute its 1.95 percent adjustment to the "bare bones" cost of equity. The Staff formula used to derive this 1.95 percent adjustment is explained in Footnote 16 on page 19 of Staff's initial brief. Tidewater (p. 36 of reply brief) describes this formula as consisting of "multiplying Tidewater's earnings-price ratio by the proportion by which 1.40 exceeds the actual ratio of market value to book value". Tidewater attacks the Staff's 1.95 percent adjustment on the following grounds:

(1) It contends that the record is totally devoid of any support for any such adjustment, and notes that the Commission stated in Phillips:

> There is no mathematical way to make such an allowance . . . (Op. 338, p. 571)

Tidewater omits to mention, however, that the Commission, immediately after making this statement, concluded:

> . . . we think that the .75 percent used by the Staff witness would be a correct adjustment to make. (Op. 338, p. 571)

(2) Tidewater attacks the time period of 1953-57 used by the Staff in its computation of this adjustment, contending that this time period is wholly inappropriate and unrepresentative of conditions in the more recent past; that Tidewater stock has been selling for the last two years (1959 and 1960) at barely more than two-thirds of its book value, which was over $30.00; that the computation should therefore be made on the basis of data for the years 1959-60, and such a computation would result in an equity allowance of over 20 percent.

It is concluded, however, that the 5-year period 1953-1957 employed by Staff is more appropriate for this purpose, since it is at once long enough to be more truly representative of the long-run situation, while still properly and sufficiently reflecting current and recent trends. There is no evidence to indicate that the relationship of Tidewater market prices to book value which pertained for the two years 1959 and 1960 reflects any continuing trend which can be expected to continue for the future. In addition, it should be noted that the Commission in Op. 338 found that an adjustment of only .75 percent over and above the "bare bones" cost of equity was "a correct adjustment to make". In the instant proceeding the Staff has employed a substantially *higher* adjustment of 1.95%. In the light of these circumstances, the Staff's proposed adjustment to the "bare bones" cost of equity is regarded as satisfactory.

Earnings-Book Value Ratios

Staff's initial brief (p. 19) notes that its 39-company group of integrated and unintegrated gas producers had average earnings-book value ratios of 14.6 percent during the period 1953-57, and that Tidewater itself had an average-earnings book value ratio of 11.92 percent during the same period (Item S, p. 15). The Staff therefore concludes that the 13.2 percent equity allowance recommended by it "provides an earnings-book ratio that lies midway between the industry's 14.6 percent and Tidewater's 11.92 percent." (initial brief, p. 20)

Tidewater attacks this Staff use of earnings-book value ratios on the following grounds (reply brief, p. 37):

(1) It contends that it is irrelevant and circular reasoning to make the return allowance dependent on the return earned by the subject company. This criticism must be regarded as without merit, in view of the fact that the Commission in the *Phillips* case noted "the comparatively high earnings on equity of the integrated companies" (which amounted to 15.3 percent or 14.8 percent depending upon the time period used) and "the even higher earnings of the producers" (which amounted to 19 percent), but then concluded that these were

> offset by the fact that Phillips' own unregulated earnings on equity have been just a little over 12 percent. (Op. 338, p. 573)

(2) Tidewater attacks the Staff's use of its own average earnings-book ratio of 11.92 percent on the ground that this is not the return earned by Tidewater's *production* operation, but by the integrated company. For similar reasons, Tidewater attacks Staff's use of the 14.6 percent earnings-book value ratio of its 39-company group of integrated and unintegrated gas producers, contending that "Tidewater's return on gas operations must be determined by reference to returns earned by *producers*, that engage primarily in production operations, and not by reference to companies whose production earnings are obscured and distorted by refining and marketing operations." (reply brief, p. 37; also initial brief, p. 84-88)

This position was squarely rejected by the Commission in the *Phillips* case, Op. 338, where the Commission, in discussing the use of earnings-book value ratios stated:

> This approach as employed by Phillips, however, mistakenly relies on the Class A producer companies whose operations differ from Phillips' integrated operations. (Op. 338, p. 571)

The Commission then noted and considered the earnings-book value ratios for the Class C integrated companies, for a 40-company group including both integrated and unintegrated producers, and the earnings-book value ratios

for Phillips itself. In addition, in considering Phillips' own experience, the Commission noted and gave weight to the earnings-book value ratio *of the entire integrated company*, making no attempt to determine the return earned by Phillips' production operations alone. In so doing, the Commission reflected its conclusion that "the financing of Phillips and its capital costs are affected by the nature and success *of the whole business*." (p. 569) It is also interesting to note that in Op. 340, *United Carbon Company*, the Commission, in considering earnings-book value ratios in connection with its rate of return discussion, gave consideration to and characterized as "significant" the average earnings-book value ratios of the identical 39-company group of integrated and unintegrated gas producers used by Staff in the instant proceeding. (Op. 340, p. 186)

(3) Tidewater further attacks the Staff's use of earnings-book value ratios on the ground that there is no support in the record for choosing 1953-57 as the base period for the application of the comparable earnings test. Tidewater states:

> While a five-year period is normally sufficient to establish representative averages for traditional public utilities, the substantial variations of producer earnings from one year to the next make it necessary to use a longer period of time. (reply brief, p. 38)

Tidewater accordingly suggests that it is necessary to use a period running from eight to ten years in order to derive meaningful averages.

This contention is completely disposed of by the Commission's treatment of similar problems in the *Phillips* case. In that case Phillips, in employing the earnings-price ratio technique, used the 9-year period 1947-1955, contending that the longer period was more truly representative of the long-run situation. The Commission, however, held:

> We agree with the examiner that the appropriate period was the five years, 1951 to 1955, because that reflects the more recent trend of earnings-price ratios. (Op. 338, p. 571)

The rationale for giving some consideration to *earnings-book value ratios* was explained by the Commission in its *Phillips* decision as follows:

> Although actual earnings related to book value cannot be decisive in determining a fair return, they constitute an important factor as showing what comparable companies are earning on the book value of their assets and the relation of Phillips' earnings to their earnings. (Op. 338, p. 571)

Similarly, in its Interim Rate of Return Order in the *Tennessee Gas Transmission Company* case (Docket G–19983, August 9, 1960) the Commission stated:

> We have, however, given consideration to the evidence of the return on book equity of Tennessee as compared with the other major pipeline companies as a factor in fixing a return which is commensurate with returns on investments of other enterprises having corresponding risks . . .

In view of the rationale set forth above, the mere fact, as stressed by Tidewater, that producer earnings allegedly show substantial variations from year to year, should not cause any concern. Instead, our objective should be to use a period which is recent enough so that it reflects a trend which is representative of what may be expected for the future; but at the same time to use a time period which is sufficiently long to include a representative spread of the highs and lows normally experienced. An examination of the earnings-book value ratios for producers in general, set forth in Staff's Item S, at pp. 14-15, demonstrates that the 1953-1957 period clearly satisfies these standards.

The average earnings-book value ratios, by categories, for each year from 1949 to 1957 are set forth below:

[Percent]

Years	Staff's 39-company group of integrated and nonintegrated gas producers	Class A producers	Class B producers	Class C producers	Class D producers	Tidewater
1949	18.4	21	30.3	15.9	----------	12.4
1950	17.7	17.6	32.2	16.2	----------	14.3
1951	21.3	27.9	27.7	17.1	----------	14.6
1952	17.4	21.3	20.5	15.0	----------	11.2
1953	17.0	19.5	16.9	15.4	17.4	12.8
1954	13.8	14.2	18.0	12.8	17.8	13.4
1955	13.8	14.4	12.5	13.3	18.5	12.3
1956	14.2	14.1	15.1	14.2	15.4	11.8
1957	14.2	15.6	17.2	12.7	16.4	9.3

The above figures show clearly that the earnings-book value ratios for the years 1949-1950 and 1951 were unusually high; that beginning with the year 1952 such ratios have trended downward; that accordingly the addition of data for the years prior to 1953 would have a distorting effect, producing a ratio not representative of the future; that the period 1953-1957 more correctly indicates what comparable companies are currently earning on the book value of their assets, and what they may be expected to earn on book value in the future.

The Commission reached this same conclusion in Op. 340, *United Carbon Company*, where it stated:

> the record shows that between 1950 and 1957 producer earnings on the book value of their shares remain constant or trended downward . . . (p. 186)

In that decision the Commission characterized as "Also significant" the average earnings on equity of the same 39-company producer group here used by the Staff, using the data for the identical 1953-1957 time period which is relied on by the Staff in the instant case. The Commission there took note of the fact that "These earnings averaged 14.4% for the period 1953-1957." (p. 9)

Although earnings-book value ratios thus constitute a significant factor to be considered here, there is one *caveat* which must be borne in mind in this connection. In its Order Denying Application for Rehearing, issued September 27, 1960 in the *Tennessee Gas Transmission Company* case, Docket G-19983, 24 FPC 525, the Commission stated:

> One such other factor is earnings on book equity, and Tennessee relies heavily in support of a higher allowance for equity on evidence of such earnings. We have given due consideration to this evidence as a factor in our determination of the allowance to be made, although such return cannot be taken as a direct measure of the allowance for equity. Such return includes contingent earnings under rates subject to refund in proceedings before the Commission. To fix a rate of return for the future on the basis of the historical return on book equity as Tennessee urges would be improperly to validate such contingent earnings. (p. 526)

In addition, in a subsequent pipeline rate case, *Kansas-Nebraska Natural Gas Company, Inc.*, Op. 343, (March 8, 1961), 25 FPC 448, the Commission in discussing the rate of return issue referred to "earnings on equity" data as "while not controlling, but of significance"—but concluded with the statement that

> These earnings are subject to the disability that they include non-jurisdictional business and reflect earnings subject to refund. (p. 452)

It is relevant to note that the earnings-book value ratios of gas producers are subject to the "disability" referred to by the Commission in the above decisions—*i.e.*, they reflect and include earnings under rates which are subject to refund in proceedings presently pending before the Commission. This situation does not represent a "disability" in connection with earnings-*price* ratios, since we are there only interested in measuring what investors will pay for the common stock in relation to earnings. However, in the case of earnings-*book* value ratios the relevance and significance of these ratios lies in the fact that they show "what comparable companies are earning on the book value of their assets" (Op. 338, p. 571). In this latter case, to the extent that the earnings figures include substantial amounts which may later be subject to refund, these figures may not show an accurate picture.

Equity Return Allowed Various Pipelines

The Staff also lists "returns on equity for pipelines" as another factor to be considered, and concludes that its recommended 13.2% equity allowance would be "above the equity return allowed various pipelines". (initial brief, pp. 19-20)

The Tidewater reply brief (p. 38) assails this Staff conclusion as "clearly in error". Tidewater contends that the record shows that a representative group of nine natural gas pipelines had average earnings of 14.9% on common equity in the 1950-57 period (Exh. 138, Sched. 28), and that the Commission itself "stated in Trunkline Gas Co. *et. al.*, Op. 339 . . . that nine pipelines had average earnings of 15.7% on common equity in the years 1955-59." Tidewater concludes that on this basis its return on equity should be above 15 percent. In support of this conclusion, it cites the Commission statement in *Phillips*, Op. 338 (p. 572) that:

> It is clear that the risks of this business are greater than those of an electric utility or natural gas pipeline. While we cannot rigidly compare these companies with Phillips, for the circumstances and times are different, we do think that *an allowance for common equity* for a producer should be comparable to or greater than that for a pipeline company or an electric company. (emphasis supplied)

It is important to note, however, that in the *Phillips* case the Commission at this point set forth data showing the return or allowance which *the Commission had granted* for common equity in a number of different pipeline or electric utility cases, in decisions issued in the years 1949, 1954, 1956, 1958 and 1960. The allowances granted for common equity in these decisions ranged from 8.64% up to 14.4%. After reviewing this data, however, the Commission in Op. 338 finally approved an equity allowance for Phillips of *12%*. It is interesting and significant to note that this approved equity allowance was two percentage points above the allowances granted by the Commission in the two *1960* pipeline decisions which were included in the above-mentioned pipeline equity allowance table—*i.e.*, (1) the *Southern Natural Gas Co.* (G–20509) decision of July 8, 1960, 24 FPC 26, approving a 10.18% equity allowance, and (2) the *Tennessee Gas Transmission Co.* (G–19983) decision of August 9, 1960, 24 FPC 204, approving a 10.12% equity allowance.

Subsequently, in Op. 340, the *United Carbon and Columbian Fuel case*, the Commission stated:

> In the *Phillips* case we cited several electric and gas pipeline cases showing *allowances* for common equity ranging from 8.64% up to 14.4 percent because we were of the opinion that the allowances for common

equity for a producer should be comparable to or greater than that for a pipeline or an electric company.

The Commission then proceeded to grant an allowance of 11.5% on common equity for United Carbon, and 11% for Columbian Fuel. (p. 187)

It should be noted that the Tidewater contention, outlined above, is based upon a totally different use of pipeline data than that which the Commission employed in its *Phillips* (Op. 338) and *United Carbon* (Op. 340) decisions, *supra*. The pipeline data cited by Tidewater consists of the average earnings made and enjoyed by nine selected pipelines on their common equity in the period 1950-1957—whereas it seems clear that under the standard laid down by the Commission in its *Phillips* and *United Carbon* decisions, our concern should be with the level of the *allowances* on equity *which the Commission is currently approving* for pipeline companies, *under current conditions*. Under the standard as thus laid down by the Commission, the relevant fact to be noted here is that the Commission in the most recent period of 1960-1961 has been uniformly granting allowances on common equity in pipeline rate proceedings in the range of 10% to 10.8%, as follows:

[Percent]

	Allowance on common Equity	Equity ratio
Kansas-Nebraska Natural Gas Company, Inc. Op. 343 (Mar. 8, 1961)	10.8	33.78
Manufacturers Light & Heat Company 23 F.P.C. 446 (Feb. 25, 1960)	10	40
Northern Natural Gas Company Op. 342 (Mar. 7, 1961)	10.5	31.37
Panhandle Eastern Pipeline Company G-19780, Order of Mar. 20, 1961	10.47	40.02
Southern Natural Gas Company 24 F.P.C. 26 (July 8, 1960)	10.18	35.8
Tennessee Gas Transmission Company G-19983, Interim Order of Aug. 9, 1960	10.12	29.5

Under these circumstances, if Tidewater were here allowed a return of 13.2% on common equity, as recommended by the Staff, such an allowance would be 2.4 percentage points higher than the maximum equity allowance approved by the Commission in pipeline rate proceedings in the most recent current period.

Tidewater Allegations Re High Risk Borne By Gas Producers

In Tidewater's initial brief, the rate of return presentation is opened with a lengthy discussion (pp. 66-76) of the alleged "high risks" borne by natural gas producers. In its reply brief (pp. 38-39) Tidewater charges that the Staff discussion of rate of return is marked by "the total absence of any discussion of the fundamental risk characterizing gas operations, namely the risks associated with exploration". On the other hand, intervenors' reply brief takes issue with each of these general allegations, in a lengthy argument at pp. 4-12. This entire discussion, however, plows ground which was fully covered in a most extended manner in the *Phillips* case, in such a way as to make it quite unnecessary and unfruitful to re-hash these matters in the instant proceeding. In the Commission's discussion of rate of return in the *Phillips* case, it took note of and considered the "extensive presentation" there made by Phillips, which embodied "complaints about the hazards of and the meager returns from exploration and development". Having thus considered the problem of the risk borne by gas producers, the Commission there concluded that "some allowance must be made in the rate of return" to provide the required incen-

tive "to promote the continued exploration for and production of gas". The Commission thereupon resolved this problem in Op. 338 by adding two percentage points to the 10 percent allowance which had been derived for common equity under the earnings-price ratio method [34], producing an ultimate allowance of 12 percent for common equity. [35]

In its subsequent decision in the *United Carbon Company* case, Op. 340, the Commission again considered the additional incentive required for independent producers, stating:

> Furthermore, to maintain the present rate of deliveries there must be an expanded program of drilling, and to find new gas reserves, wells must be drilled to the deeper horizons at increasing cost. Thus, there must be a sufficient incentive to enter into such a program in view of the increased difficulties and expenses involved, even though the record shows that the ratio of successful wells to total wells drilled has been high.

The Commission then concluded that this objective was met by providing an allowance of 11.5 percent on common equity for United Carbon and an allowance of 11 percent for Columbian Carbon, citing its action in the *Phillips* case. (Op. 340, p. 186)

Relevant Tidewater Operating Characteristics

In its *Phillips* decision the Commission took into consideration, among other things, certain favorable characteristics with regard to Phillips' financial condition and operations. It stated in this connection:

> Phillips, as already noted, is a large company with assets of over a billion dollars, whose gas business is only a small fraction of the whole. Such a company is in a very strong position to raise capital. As a company with a continuing program of exploration and production it differs from other companies whose activities are sporadic or are merely holding reserves. (Op. 338, p. 569)
>
> * * * * * * *
>
> . . . we also bear in mind that Phillips is a large company and well established in the conduct of its gas business, its oil business and its other extensive operations. (Op. 338, p. 573)

The record in the instant proceeding indicates similarly that Tidewater occupies a favorable position in the industry, as indicated by the following facts which are adopted from the intervenors' initial brief, at pages 5-6:

> Tidewater, like Phillips, is a fully integrated oil company, with investments on all levels of the oil industry. In 1957, its sales and other revenue totalled $594,386,000, and its capital expenditures $140,231,000. Of the latter total $88,462,000 was expended for facilities to refine, transport and market crude oil and its products. The company's net production of crude oil in 1957-34, 119,000 barrels—accounted for less than half of its refinery throughput of 77,005,000 barrels (Ex. 144, p. 22)
>
> By any standards Tidewater, like Phillips, is a 'major' oil company. In

[34] The 10 percent allowance was derived by adding to an average earnings-price ratio of 8.5 percent: (a) an allowance of .75 percent for the cost of financing, and (b) an investment factor of .75 percent over the "bare bones" cost of equity, designed to maintain the market price of Phillips common stock at around 1.40 percent of book value, in order to enable the company to attract capital at reasonable cost.

[35] In its later Op. 344, *Panhandle Eastern*, p. 18, the Commission characterized this process which it had gone through in Op. 338 as follows:

In the *Phillips* case we added two percentage points to the 10 percent allowance for common equity in order to provide this incentive.

1957 it ranked twelfth in assets and fourteenth in sales among all oil companies. Similarly, Tidewater, like Phillips, is among the largest producers of natural gas. In 1957 its direct sales of gas in interstate commerce placed the company among the top twenty producers. Like Phillips, its natural gas revenues sharply increased during the decade of the 1950's, rising no less than 319.4 per cent between 1950 and 1957, or from $3,390,000 to $14,218,000 (Ex. 138, Sched. 3, p. 2). In spite of this, the relative importance of these revenues to the company as a whole remains relatively small, in which respect its situation again is remarkably akin to that of Phillips. Thus, in 1957, Tidewater's natural gas sales of 105,154 MMcf accounted for only 2.38 per cent of the company's consolidated total revenues (Ex. 138, Sched. 3, p. 2)

In addition, it is relevant to note that Tidewater's earnings available for common stock on a per share basis ranged between $2.00 and $2.84 during the period 1950 to 1957 (31:4960); and that its net worth increased from $255,550,000 as of December 31, 1950, to $449,634,000 at December 31, 1957. Its reserves of natural gas increased by 139.77 percent during this period. (31:4963) Tidewater's reserves of natural gas in 1950 were equivalent to 29.8 years of production, whereas the reserves of natural gas for the United States as a whole amounted to only 26.9 years of production. Similarly, in 1957 Tidewater's gas supply was equivalent to 27.4 years of production, as compared with the lower figure of 21.4 years on a nation-wide basis. Thus Tidewater's position was continuously maintained at a higher level than that for the United States as a whole. (31:4963)

Tidewater's natural gas sales rose from 40,059,000 Mcf in 1949 to 121,531,000 Mcf in 1958. (Exh. 144, p. 22) The average price received by Tidewater for its natural gas sales rose from 7.5 cents in 1950 to 13.5 cents in 1957. (Exh. 144, p. 22; Exh. 138, Sched. 3, p. 2)

It is true that Tidewater's net income for 1958 showed a deficit of 3 cents per share. However, in the company's annual report for that year, this situation was explained as having resulted principally from "limited access to low-cost raw materials due to imposition of Federal controls on oil imports and allocation to Tidewater of an inequitable import quota." (Exh. 144, p. 3) It should be noted, however, that this was only a temporary situation and that Tidewater's earnings had again risen to $2.23 per share in 1959 and $2.39 per share for the twelve months ending September 1960. (Tidewater reply brief, p. 36, footnote 36)

Summary of Determinative Rate of Return Factors

A. *The Phillips Case*

In the *Phillips* case (Op. 338), the Commission gave consideration to the following factors:

(1) *Earnings-Price Ratios*—The Commission noted that Phillips' average earnings-price ratio for the 5-year period 1951-1955 was 8.8 percent, and that the 5-year average for a 41-company group, including Class A, Class B, and Class C producers, was 8.5 percent. Following and adopting the Staff method as there presented, the Commission added to the 8.5 percent average earnings-price ratio of the 41-company group an allowance of .75 percent for the cost of financing, and a further allowance of .75 percent over the "bare bones" cost of equity as an investment factor designed to maintain the market price of Phillips common stock at around 1.40 percent of book value. This resulted in an adjusted earnings-price ratio of 10 percent.

(2) *Earnings-Book Value Ratios*—The Commission gave consideration to the earnings-book value ratios for the Class C integrated companies, which

amounted to 14.8 precent for the five-year period 1951-1955 and 15.3 percent for the seven-year period 1949-1955; and the earnings-book value ratios of the 40-company group of integrated and unintegrated producers, amounting to 17 percent for the five-year period 1951-1955. However, the Commission gave weight to the fact that Phillips' own earnings-book value ratio had been only 12.3 percent for the five-year period 1951-1955 and 12.1 percent for the seven-year period 1949-1955.

(3) *Equity Return Allowed for Pipelines*—The Commission gave consideration to the fact that it had approved allowances for common equity ranging from 8.64 percent up to 14.4 percent in electric and gas pipeline cases, in decisions issued between 1949 and 1960.

(4) The Commission concluded that an additional increment should be added to the determined allowance for common equity, in order to provide the required incentive to encourage continued exploration for and production of gas.

(5) The Commission noted that Phillips' capitalization consisted of 88.4 percent equity and only 11.6 percent debt. It concluded that Phillips' allowance for common equity should be limited by its high equity capitalization, which contributed to reducing the risk.

(6) It finally noted that Phillips was "a large company and well-established in the conduct of its gas business, its oil business and its other extensive operations." (Op. 338, p. 574)

(7) After considering all of the above factors the Commission added two percentage points, as an incentive factor, to the adjusted 10 percent allowance for common equity derived under the earnings-price ratio method—producing a final allowance for common equity of 12 percent, and this resulted in an over-all rate of return of 11 percent for Phillips.

B. *The United Carbon Company case (Op. 340)*

In the United Carbon Company case the Commission gave consideration to the following factors: (a) the average earnings-price ratios of 39 integrated and unintegrated producers, amounting to 7.4 percent for the five-year period 1953-1957; (b) the need for an additional allowance necessary to cover cost of financing and to enable the company to attract capital at reasonable cost; (c) the average earnings-book value ratios for the 39-company producer group amounting to 14.4% for the period 1953-1957; (d) the allowances for common equity in electric and gas pipeline cases, ranging from 8.64 percent to 14.4 percent. The commission then took note of the fact that in the *Phillips* case it had approved an allowance of 12 percent on common equity and an over-all rate of return of 11 percent. After considering all these factors, the Commission approved an allowance of 11.5 percent on common equity for United Carbon, and 11 percent for Columbia Carbon, producing an over-all rate of return of 11 percent for United Carbon and 10 percent for Columbian Fuel Corporation.

C. *The Instant Tidewater Proceeding*

In the instant Tidewater proceeding, in addition to all of the considerations set forth above, particular weight has been given to the following factors:

(1) Earnings price ratios: Tidewater's own earnings-price ratios, averaging 10.48 percent for the five-year period 1953-1957.[36] There has been added to this figure an additional 1.95 percent (proposed by Staff) as an adjustment over "bare bones" cost of equity (this being substantially higher than the

[36] This, of course, is a substantially higher earnings-price ratio than the average earnings-price ratios for the same period for the 39-company group of integrated and unintegrated gas producers amounting to 7.44%.

similar adjustment of .75 percent adopted by the Commission in the *Phillips* case, *supra*). The result is to produce an adjusted earnings-price ratio in this case of 13.18 percent.

(2) *Earnings-book value ratios*—Consideration has also been given to Tidewater's own average earnings-to-book value ratio of 11.92 percent for the five-year period 1953-1957, and the earnings-book value ratios averaging 14.6 percent for the 39-company group of integrated and unintegrated producers during the same period.

(3) *Equity return allowed to pipelines*—Consideration has in addition been given to the allowance on equity approved by the Commission in pipeline rate proceedings during the years from 1949 to 1960, ranging from 8.64 percent to 14.4 percent, with particular recognition of the fact that such allowances have been approved only in the range of 10 percent to 10.8 percent during the most recent period 1960-1961.

(4) *Additional incentive to encourage continuing exploration for and production of gas*—If we here added to the adjusted earnings-price ratio of 13.18 percent, referred to above, the same incentive factor of two percentage points which was adopted by the Commission in the *Phillips* case, this would bring the Tidewater allowance for common equity up to a level of roughly 15 percent. It is of interest to note that such a 15 percent equity allowance would be substantially higher than Tidewater's own average earnings-book value ratio of 11.92 percent. It would also be higher than the maximum equity allowance approved by the Commission in the previous electric and gas pipeline cases cited in Op. 338, and far higher than the equity allowances ranging from 10 percent to 10.8 percent which the Commission has been approving in pipeline rate proceedings in the most recent period of 1960-1961. It is further noted that it would be substantially higher than the 12 percent equity allowance which the Commission approved for Phillips in Op. 338, or the 11.5 percent and 11 percent equity allowances approved by the Commission for United Carbon Company and Columbian Fuel Corporation in Op. 340. It is recognized, however, that Tidewater with an equity of 55.7 percent has a thinner equity than either Phillips, United Carbon Company, or Columbian Fuel Corporation—and this factor must be taken into account.

Under all the circumstances, it is concluded that an equity allowance of 15 percent for Tidewater represents the maximum allowance which can be justified in this case.

On the basis of a 15 percent allowance on common equity, an over-all rate of return of 10.025 percent is obtained, which should be rounded off to 10 percent. It is therefore concluded that a fair rate of return for Tidewater in the instant proceeding is 10 percent.

Tidewater Contention That Its Producing Operations Should be Treated As Financed Entirely By Common Stock

Tidewater contends that its rate of return should not be computed on the basis of its *actual* capitalization, including 55.7 percent equity ratio, a 35.3 percent debt ratio, and a 9 percent preferred stock ratio; that instead its producing operations should be treated as having been financed entirely by common stock and its rate of return should therefore be computed on the basis of a 100 percent equity ratio; that, in the alternative, its rate of return should be computed on the basis of imputing to its operations a fictitious capitalization of 95% equity ratio and 5% debt ratio, representing the average ratio of common stock capital to total capital for eight selected strictly producer companies (Class A producers).

In support of this position, Tidewater contends that a detailed study of its debt financing reflects that "'practically its entire debt' was incurred in connection with the expansion of refinery transportation and marketing operations." (reply brief, p. 79) This conclusion itself is subject to some doubt, since Tidewater's own evidence established that it has floated many millions of dollars of bonds expressly for the financing of production operations. As Tidewater itself notes (reply brief, p. 31) the Prospectus issued in 1956 in connection with its flotation of debt securities showed the application of proceeds from debt financing and bank borrowing as including $53 million for "Domestic and foreign exploration and acquisition and development of prospective and proven oil and gas properties, including the offshore drilling program." Tidewater rate of return witness, Badger, concluded that the funds obtained by debt financing and bank borrowing which were shown in this Prospectus as designed for use in connection with exploration and development operations must actually have been used instead for Tidewater's refining and marketing operations, with the result that all of the funds devoted to exploration and production during the period must have come from self-generated funds or internally-generated funds (37:5730-32). This, however, was mere speculation. Tidewater itself did not rely upon or attempt to use this explanation in its reply brief—but instead substituted a totally new explanation, *i.e.*:

> The $53,000,000 fund set aside for exploration and development was earmarked for *both* domestic and foreign operations so that it is quite apparent that only a small portion of debt financing, if any, was earmarked in connection with domestic exploration or production operations. (reply brief, p. 31)

However, this conclusion is equally speculative.

Furthermore, entirely apart from the speculative factual question referred to above, the Tidewater position is erroneous as a matter of *principle*, in that it represents an attempt to determine the rate of return required to maintain Tidewater's financial integrity and to enable it to raise the necessary capital, not on the basis of the nature and success of its entire operation, but rather by treating it as if it were engaged solely in the oil and gas production business. This approach was completely rejected by the Commission in the *Phillips* case where, in connection with a somewhat similar problem the Commission stated:

> Phillips argues that it is a fallacy to apply to gas production operations a rate of return based upon the over-all cost of its capital because of the peculiarly risky nature of the oil and gas production business. It says that the cost of capital for the enterprise as a whole is less than the cost of capital for these risky operations. *However, the financing of Phillips and its capital costs are affected by the nature and success of the whole business*, and it would be impossible on this record to determine the cost of capital for part of its business. (p. 569, emphasis supplied)

A final flaw in this Tidewater position lies in the fact that if its rate of return were to be computed on the basis of imputing to its operations a fictitious capitalization of 95 percent equity ratio and 5 percent debt ratio, representing the average ratio of common stock capital to total capital for eight selected strictly producer companies (Class A producers), it would then be necessary for purpose of consistency, to use in our earnings-price ratio calculation the *substantially lower* average earnings-price ratios for the period 1953-57 *of the Class A strictly producer group*, amounting to 5.2 percent—in place of Tide-

water's own average earnings-price ratio of 10.48 percent which was used in the Staff calculation. In other words, if Tidewater is thus to be converted into a strictly producer Class A company, for the purpose of the rate of return computation, then it seems clear that in applying the earnings-price ratio computation the average earnings-price ratios of the Class A strictly producer group should be employed. The Commission recognized this very consideration in Op. 338, in connection with its rejection of the Phillips contention that its rate of return should not be based upon the over-all cost of its capital, but rather upon the basis of its oil and gas production operations alone. After concluding that "the financing of Phillips and its capital costs are affected by the nature and success of the whole business", the Commission went on to point out:

> Furthermore, the evidence indicates that the companies that are solely producers have a higher market demand for their equity securities in relation to earnings than the companies with integrated operations. This is possibly because investors sought a hedge against inflation and invested in these stocks in order to acquire a share in raw materials in the ground. In any case, investors, according to the record, appear willing to accept a lower return from purely producing companies than from the integrated companies.

It would be interesting, in connection with this Tidewater proposal, to make a rough computation of the type of rate of return which would be derived here if we were to substitute the average earnings-price ratio of the Class A strictly producer companies, amounting to 5.2 percent, in place of the Tidewater 10.48 percent earnings-price ratio used by the Staff. If we added to the 5.2 percent figure an additional .75 percent for cost of financing, and the same 1.95 percent "bonus" used by Staff, the result would be an adjusted allowance for equity of 7.90 percent under the earnings-price ratio method. If we further added to this figure the same additional 2 percent allowance added by the Commission in Op. 338 to provide the necessary incentive to encourage continued exploration for and production of gas, the final result would be an equity allowance of 9.90 percent. Using Tidewater's suggested capitalization of 5 percent debt and 95 percent equity, this would produce a rate of return of 9.58 percent—somewhat lower than the 10% rate of return here approved.

The final answer to this Tidewater contention is as follows: In Op. 338 the Commission did not adopt the method here urged by Tidewater, but instead computed Phillips' required rate of return on the basis of its *actual* capitalization including 88.4 percent equity and 11.6 percent debt. At the same time, the Commission characterized Phillips' actual equity ratio of 88.4 percent as a relatively *high* equity ratio, which "reduces the risk found in companies of thinner equity". The Commission then included

> While we believe that Phillips should be granted an allowance for common equity in excess of 10% our allowance will be limited by Phillips' high equity capitalization. (Op. 338, p. 573)

Thus we are confronted in the instant proceeding with a Tidewater proposal that its rate of return should be computed on the basis of a fictitious capitalization, under which there should be imputed to it a *higher* fictitious equity ratio as a basis for *increasing* the computed rate of return. Yet, in Op. 338 the Commission used Phillips' actual capitalization and treated its high equity ratio as a basis for *limiting* the equity allowance required for Phillips.

In view of all the considerations outlined above, it is concluded that the instant Tidewater proposal should be rejected and that its rate of return should be computed upon the basis of its actual capitalization.

Tidewater's Market Price Argument

At pages 98-109 of its initial brief, Tidewater makes an elaborate argument designed to establish that its market price evidence presented in the instant proceeding confirms the lawfulness of its natural gas prices. In this connection, it asserts that in order to apply the competitive market price standard it must first be established "that effective and workable competition exists in the market in which producers sell natural gas". It then proceeds to argue that there *is* "effective competition", on the basis of elaborate evidence incorporated by reference from the *Omnibus* proceeding. Tidewater accordingly contends that the market price evidence which it has presented in the instant proceeding is relevant and determinative, and that it fully confirms the lawfulness of its jurisdictional gas rates.

An extended consideration and discussion of this Tidewater market price argument has been rendered unnecessary by the recent decision of the Court of Appeals in *The United Gas Improvement Company* v. *F.P.C.*, 290, F. 2d 133. (C.C.A. 5, February 22, 1961). The majority decision of the court in that case disposes of the market price argument in such simple and lucid terms, cutting through to the very heart of the matter, that no substantial further comment would seem to be required. In that case (involving a question as to the imposition of a rate condition in a producer certificate proceeding) the court held that field price evidence was not sufficient to justify the initial rate there proposed, stating:

> The only evidence on this record that supports such 'out-of-line' price is the fact that it was negotiated at arm's length and was required by the intense competition. This, as we have said, is not enough. (slip opinion, p. 13)

The court recognized that there was "intense competition" and a "highly competitive market". However, the court held:

> As we have previously stated in *Bel Oil Corp.* v. *F.P.C.* . . . a price paid for gas as the result of arm's length bargaining with the producer is not, merely because bargained for in a highly competitive market, 'just and reasonable' within the intendment of the Natural Gas Act. . . . This is so because the only justification for giving the Commission the duty to regulate prices was the determination by Congress that *the producers have a supply that is so restricted in relation to demand that they have the economic power to bargain for prices that will be injurious to the public.* (slip opinion, p. 6)
>
> * * * * * * *
>
> This discussion by the responsible parties who fixed this initial price makes it perfectly plain that a substantial part of the increase from 'nine to twelve cents' to 21½ cents *resulted from the tremendously increased demand as contrasted with the available supply.* (slip opinion, p. 8) (emphasis supplied)

Under these circumstances, the court concluded that the mere fact that the proposed price had been bargained for at arm's-length, or that the prices "were not higher than a price someone else was then paying in the area" was not sufficient. (slip opinion, p. 7)

The court then addressed itself to the question as to how the Commission might properly determine whether an initial price was "out of line" in such a way as to require the imposition of a rate condition. It stated:

> The principal question here is whether the line is established by proof of what others are paying under certificates that were either uncontested or were being appealed and are thus 'suspect,' or what others are paying based on such 'suspect' rates, or what even unregulated intrastate purchasers are paying. (slip opinion, p. 11)

The court concluded that "the line" could not be satisfactorily established by any of these different types of field price situations.

The court finally held that a price "much higher than any theretofore certificated *according to the standards found by the reviewing court to be consonant with CATCO* will unquestionably breach 'the line'." (slip opinion, p. 12-13)

It appears to be the clear implication of the above language that only field prices which had previously been certificated by the Commission under standards consistent with the principles laid down by the Supreme Court in its CATCO decision (*The Atlantic Refining Co., et al.* v. *Public Service Commission of the State of New York, et al.*, 360 U. S. 378, may properly be considered in arriving at a determination as to what is "out of line".

The usefulness of market price evidence of this type was similarly questioned by a decision of the Ninth Circuit in *The United Gas Improvement Co.* v. *F.P.C.*, 283 F. 2d 817, (Oct. 31, 1960), another rate condition case where the court held:

> When an order certificating an initial rate is under court or Commission review, it is possible that the certificate may be eventually denied or price conditions may be attached. In our opinion an existing rate subject to such a hazard does not provide a reasonably reliable basis upon which to predicate a price line. In the event the existing rate is later modified or conditioned as a result of the pending proceedings the foundation of the line derived therefrom would be undermined. Moreover, the acceptance of questioned existing prices as a guide in setting the line might itself have the anomalous effect of creating a standard by which the questioned rates would then be judged.
>
> For the reasons indicated we are of the opinion that it would be an abuse of discretion for the commission in establishing a price line to rely upon producer prices which are under such a cloud.
>
> *We go further and express the view that where a substantial number of certificated prices are thus under court or Commission review, like prices in the same area though not currently under review ought to be regarded as suspect. In such circumstances it would seem that such similar* prices ought not to be relied upon in fixing a line except upon evidence and findings to the effect that they are not subject to the same infirmities which are under test in the pending proceedings. (283 F. 2d at 824; emphasis supplied)

A similar decision was issued by the Court of Appeals for the District of Columbia Circuit in *Public Service Commission of the State of New York* v. *F.P.C.*, 287 F. 2d 143 (Dec. 8, 1960).

There can be no doubt that the market prices (or field prices) cited by Tidewater in the instant proceeding have not been subjected to the tests required by the Supreme Court's decision in CATCO, or by the above-mentioned Court of Appeals decisions. Furthermore, there can similarly be no doubt that

the field prices cited by Tidewater relate to sales in areas where a substantial number of certificated prices are under court or Commission review.

It is true that the decisions referred to above involved the rate condition question in producer certificate proceedings. However, if field prices which have thus been branded by the courts as "suspect" cannot properly be used as a basis for determining whether to impose a rate condition in a certificate proceeding, where the only object is to hold the line until a determination can ultimately be made as to the "just and reasonable" rate for such sales, then certainly such "suspect" field prices may not properly be relied upon as a basis for determining the "just and reasonable" rate itself—this being the end objective of all price regulation by this Commission.

Tidewater's Presentation with Respect to "Cost Trends and Economic Evidence"

At pages 109 to 117 of its initial brief Tidewater makes an extended argument to the effect that cost trends and general economic evidence confirm the reasonableness of its natural gas prices, relying upon substantial evidence which it presented in this proceeding with respect to trends in production, exploration and development as evidenced by industry experience and by the operations of its own Southern Division. A great part of this evidence was similar to the major presentation made by Phillips Petroleum Company in the *Phillips* case with respect to the economic, geological and engineering aspects of our national gas supply. The Commission in its *Phillips* decision referred to and gave weight to these historical trends and concluded that

> In view of these practical problems in the gas industry some allowance must be made in the rate of return to promote the continued exploration for and production of gas. (Op. 338, p. 573)

The Commission dealt with this problem by granting Phillips an additional allowance of two percentage points, as an incentive factor to be added to the straight allowance for common equity. As already noted in the earlier discussion of the rate of return question in this decision, the same incentive allowance has been included in the approved rate of return for Tidewater in the instant proceeding.

It is concluded here that this is the only appropriate manner in which the "cost trends and general economic evidence" referred to by Tidewater may be reflected in the rates to be approved herein. In reaching this conclusion, it is to be borne in mind that unless such fragmentary cost data is considered in terms of, and as an integral part of a full cost-of-service, it cannot provide a measuring stick or standard to be used for an objective determination of "just and reasonable" rates, but could only be used subjectively as a basis for rationalizing a pre-determined rate.

It is accordingly concluded that the Tidewater presentation with respect to "cost trends and general economic evidence" can suitably be considered only in connection with the rate of return issue, and that it cannot provide, in itself, an independent basis for approval of Tidewater's jurisdictional gas prices.

The cost-of-service herein adopted for Tidewater using the methods described in detail in the instant decision, is set forth in summary fashion in Appendix A, Tables 1-7, at the end of this decision.

This cost-of-service is derived basically from intervenors' Exhibit 180 and from Appendix A at the end of intervenors' initial brief, modified and ad-

justed to reflect the following changes, all of which have previously been discussed in detail:

(1) elimination of gasoline and cycling plant expenses from off-lease expenses charged to gas,

(2) elimination of gasoline and cycling plant investment from off-lease net investment charged to gas,

(3) recomputation of the allocation factor for exploration and development costs under the Commission's *Phillips* modified Btu method, to reflect: (a) the substitution of an economic factor of three, instead of a factor of four; (b) elimination of the economic adjustment factor with respect to the Btu content of plant liquids;

(4) recomputation of the working capital allowance according to the Commission's traditional approved method,

(5) the use of a year-end rate base instead of average rate base,

(6) allowance of a 10 percent rate of return, in place of the "hypothetical" 11 percent rate of return employed by intervenors.

The result is to produce a total jurisdictional cost-of-service for Tidewater, based upon the 1957 test year, in the amount of 11.45 cents per Mcf. (Appendix A to this decision Table 1) As noted by the intervenors (initial brief, p. 32) Tidewater's rates charged for gas sold under rate schedules in effect during the 1957 test year yielded an average revenue of 14.5 cents per Mcf. and it is thus apparent that Tidewater's jurisdictional revenues for the test year 1957 on an over-all basis exceeded its jurisdictional cost-of-service by 3.05 cents per Mcf.

In determining whether Tidewater's rates are excessive, both the Staff and the intervenors adopted the normal and traditional approach of comparing Tidewater's test year *jurisdictional* cost-of-service with its *jurisdictional* revenues. In order to make the comparison on this basis, it was necessary to obtain data with respect to Tidewater's 1957 jurisdictional revenues and volumes. Because no evidence was presented showing Tidewater's jurisdictional revenues or volumes for that year, both the Staff and the intervenors have relied in their briefs upon the jurisdictional revenue and volume figures obtained from Tidewater's 1957 Form No. 301, on file with the Commission. The Staff correctly points out (initial brief, p. 22, footnote 18) that if such data had in fact been presented in evidence during the hearing, it would have been derived from the same source which provided the basis for Tidewater's Form No. 301. The Staff further points out that Tidewater, of course, attested the accuracy of its Form 301 at the time of its filing.

Tidewater, however, contends (reply brief, pp. 41-44) that its total system-wide cost-of-service should be compared with its total 1957 gas revenues derived from both jurisdictional and non-jurisdictional sales, which amounted to 12.49 cents per Mcf. (Exh. 132, Sched. 5) If the jurisdictional unit cost derived here were compared with this latter revenue figure, the comparison, of course, would be far less unfavorable to Tidewater.

On the face of it, the type of comparison here proposed by Tidewater is irrelevant and does not fairly measure what we are trying to determine here—*i.e.*, whether Tidewater is receiving excessive revenue under its existing rates for jurisdictional sales. It is apparent from the above figures that its non-jurisdictional sales were being made in the test year at relatively lower prices, on the average, than its jurisdictional sales. Accordingly, the result of adopting the Tidewater approach would be that, without any understandable justification, we would be attributing to its jurisdictional sales a totally irrelevant unit revenue figure.

The only question to be resolved here, under the circumstances, is whether the 1957 jurisdictional volume and revenue figures obtained by Staff and intervenors from Tidewater's 1957 Form 301 are properly usable in this proceeding for the purpose of determining the company's 1957 jurisdictional revenues.

In its reply brief at pages 41-44, Tidewater makes a strong attack upon the use of its 1957 Form 301 volume and revenue data, both on a number of substantive grounds and for the reason that this data was not made a part of the record as evidence in the instant proceeding. It suggests that its 1957 Form 301 figures cannot properly or reliably be used for this purpose because of a number of suggested complications which it there sets forth in detail.

The fact is that this same type of attack on the use of Form 301 data for this purpose was made by Tidewater counsel at an early stage of the hearing, in connection with the attempt by a Staff witness to employ 1955 Form 301 data as a basis for showing 1955 jurisdictional revenues and volumes. Tidewater counsel at that time suggested that the same type of alleged inaccuracies and complications were inherent in the use of its 1955 Form 301 data as it now raises with respect to the 1957 Form 301. In that connection Tidewater counsel, initially agreed that the company itself would make a study of its own records and would later present more accurate data with respect to jurisdictional sales volumes and revenues. However, at a subsequent hearing session Tidewater counsel stated that it had not been able to make such a study because the problem was a difficult one, requiring a great deal of time and effort. Tidewater counsel then stated that the company did not believe there was "enough substantial variation between what Mr. Soyster [37] has used and what might be the absolute ultimate correct item so that it would affect anything."

There then occurred this colloquy:

> Presiding Examiner . . . I take it that what you are saying now is that on more mature reflection and study you have decided that what the Staff did was not so bad after all, and that there is not really any significant discrepancy?
>
> Mr. Woodfin: Some changes were made with respect to Louisiana figures. What prompted my statement in the earlier hearing was the fact that we had done a rather hurried job in preparing the 301, and I was not prepared on the basis of the 301 to say those are the sales. But it appears that we had done probably a better job than we had thought we had done. But there is not enough difference to argue about any overall picture here, Mr. Examiner, I don't believe. (29:4391-4393)

Under the circumstances, the following considerations appear to be controlling here:

(1) Tidewater itself first injected a 1957 cost-of-service into the instant proceeding, and this change to a 1957 test year was, of course, beneficial to Tidewater since it reflected a more recent and a higher cost-of-service.

(2) The information as to the 1957 jurisdictional volumes and revenues was peculiarly in the possession of Tidewater itself, and not with the other parties.

(3) The very controversy which Tidewater counsel had raised at such length in connection with the 1955 cost studies, with respect to the accuracy of the Staff's jurisdictional volume figures obtained from Tidewater's 1955 Form 301, highlighted the importance of presenting for the record the precise figures as to the company's jurisdictional volumes and revenues. Under these circumstances, the burden was on Tidewater itself to see to it that the correct

[37] The staff witness.

figures as to 1957 jurisdictional volumes and revenues were presented for the record when the change was made to a 1957 test year.

(4) Although Tidewater devotes a great deal of time and energy toward establishing in its reply brief that the Form 301 figures are not properly useable for this particular purpose, no suggestion is made by Tidewater as to the allegedly correct 1957 jurisdictional volume and revenue figures, and it is nowhere suggested in the Tidewater briefs that the "correct" 1957 data would produce a lower unit revenue figure for jurisdictional gas than was derived by using the Form 301 data.

(5) In view of the circumstances outlined above, since Tidewater has presented nothing to the contrary, it seems entirely reasonable to assume that the declaration by Tidewater counsel that the 1955 Form 301 data did not reflect such a significant variation from the "absolute ultimate correct" data as to cause any serious problem, is equally applicable to the data presented by Staff and intervenors from the company's 1957 Form 301 filing.

Finally, although it is true that Tidewater's 1957 Form 301 was not made a part of the record as evidence in the instant proceeding, administrative notice will here be taken of this data. If it should later be shown that, unlike the 1955 Form 301 information, the 1957 filing contains truly significant errors, Tidewater may request an opportunity to make the correct data a part of the record.

Rates

Tidewater's rates which were charged for jurisdictional gas sold under rate schedules in effect during the 1957 test year yielded an average revenue of 14.5 cents per Mcf.[38] Since it has here been concluded that Tidewater's jurisdictional unit cost of service, based upon the test year 1957, amounted to 11.45 cents per Mcf, it would appear that Tidewater's jurisdictional revenues for 1957 were excessive by $2,160,464.[39]

The Commission, however, has made it clear in its *Phillips* decision, *supra*, in its Statement of General Policy No. 61–1, and in numerous other orders issued since that time, that its intent and policy is to fix just and reasonable rates for producers on an area basis rather than on an individual company basis. Under these circumstances, the determination under Section 5(a) of just and reasonable rates for Tidewater's jurisdictional sales in general, for the future, will have to await the establishment by the Commission of area rates for the producing areas in which Tidewater operates. Accordingly, the Examiner has no choice but to terminate the pending Section 5(a) proceeding against Tidewater in Docket G–13310.

This impediment, however, does not apply to the Section 4(e) rate increase dockets involved in the instant proceeding. In spite of its announced area rate policy, the Commission in the *Phillips* case itself, and in numerous other orders issued since that time, has disposed of Sec. 4(e) proceedings on the basis of individual company cost-of-service presentations where the case was tried on that basis and was ready for disposition prior to the Commission's announcement of its area price policy.[40] The instant Tidewater proceeding falls into the same category, and accordingly the Sec. 4(e) dockets here involved

[38] Based upon data in Tidewater's 1957 Form 301.

[39] Derived by multiplying the 1957 jurisdictional sales volume, obtained from the Form 301, by the difference between 1957 average jurisdictional revenue and jurisdictional unit cost as here determined.

[40] For example, see Order Accepting Offer of Settlement, *In the Matter of H. L. Hawkins and H. L. Hawkins, Jr., et al.*, Docket Nos. G–12306, *et al.* (issued April 14, 1961) 25 FPC 747; Order Fixing Just and Reasonable Rates, *In the Matter of Alfred C. Glassell, Jr., et al.*, Docket No. G–9278 (issued June 1, 1961), 25 FPC 1071.

may be disposed of on the basis of the cost-of-service determination made herein.

Under those dockets Tidewater in 1957 collected $1,824,444 of increased charges subject to refund. Since it has here been determined that Tidewater's total jurisdictional revenues in 1957 actually exceeded its jursidictional cost of service by over $2 million, no justification has been shown for approving such Section 4(e) rate increases. It is accordingly concluded that such increased rates should be disallowed and that all increased charges collected under such Section 4(e) rate filings should be refunded.

Findings and Conclusions

Upon consideration of the entire record in this proceeding, the evidence adduced and the briefs filed, the Presiding Examiner finds and concludes, in addition to the findings and conclusions hereinbefore stated, that

(1) The jurisdictional unit cost of service determined for Tidewater in this proceeding, based upon the test year 1957, is 11.45¢ per Mcf.

(2) Tidewater's jurisdictional revenues for the year 1957 were excessive by $2,160,464.

(3) Tidewater accordingly has not sustained the burden of establishing that it is entitled to the rate increases proposed in the instant consolidated Sec. 4(e) dockets.

(4) In view of the Commission's expressed policy to fix just and reasonable rates for producers on an area basis, rather than on an individual company basis, Tidewater's rates for the future cannot be fixed under Sec. 5(a) of the Act on the record made in the instant proceeding.

Order

WHEREFORE, IT IS ORDERED, subject to review by the Commission on appeal, or upon its own motion as provided in the Commission's Rules of Practice and Procedure, that:

(A) Tidewater's proposed increased rates in the instant consolidated Sec. 4(e) dockets are hereby denied—being the proposed increased rates filed as Supplement No. 3 to its FPC Gas Rate Schedule No. 34, Supplements Nos. 10, 12 and 14 to its Gas Rate Schedule No. 18. Supplements Nos. 8, 10 and 11 to its Gas Rate Schedule No. 5, Supplements Nos. 5 and 6 to its Gas Rate Schedule No. 24, Supplements Nos. 1 and 2 to its Gas Rate Schedule No. 25, Supplements Nos. 3 and 4 to its Gas Rate Schedule No. 26, Supplement No. 9 to its Gas Rate Schedule No. 49, and Supplement No. 9 to its Gas Rate Schedule No. 37.

(B) Tidewater shall, within forty-five (45) days from the date of issuance of this initial decision, refund to its customer companies, with interest at the rate of 6 percent per annum, the difference between the amounts collected under the said Supplements to the above listed Gas Rate Schedules, and the rates and charges due and payable under said Rate Schedules prior to the filing and suspension of the increased rates proposed in the said Supplements; and Tidewater shall bear the costs of such refunds.

(C) Tidewater shall, within sixty (60) days of the date of issuance of this initial decision, report to the Commission in writing and under oath the details of its calculations resulting in refunds ordered pursuant to paragraph (B) above, together with copies of releases from its customer companies with respect to such refunds.

(D) Upon satisfactory compliance by Tidewater with the refund requirements of this initial decision and order, the proceedings in the instant consolidated Sec. 4(e) dockets shall be terminated.

(E) The instant Sec. 5(a) proceeding in Docket No. G–13310 is hereby terminated.

JOSEPH ZWERDLING,
Presiding Examiner.

TRANSWESTERN PIPELINE COMPANY, DOCKET NO. CP62-185

FINDINGS AND ORDER ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued June 15, 1962)

On February 9, 1962, Transwestern Pipeline Company (Applicant) filed in Docket No. CP62-185 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing a direct interruptible sale of natural gas to Climax Chemical Company (Climax) in Lea County, New Mexico, all as more fully set forth in the application.

The proposed sale would be made from Applicant's 10-inch Monument lateral in daily volumes of up to 2,000 Mcf of gas pursuant to an agreement between the parties dated January 24, 1962. The contract is for one year with a provision for continuation of service on a year-to-year basis. The gas will be used for fuel in the Climax plant.

Applicant was granted temporary authorization to render the proposed service on February 27, 1962.

Pursuant to due notice, a public hearing was held in Washington, D. C., on June 5, 1962, respecting the matters involved in and the issues presented by the application herein. No protest to the granting of the application or petition to intervene has been received. Staff counsel moved orally at the hearing that the intermediate decision procedure be omitted and that the Commission render a decision herein pursuant to Section 1.30 (c) (1) of its Rules of Practice and Procedure.

The Commission finds:

(1) Applicant, Transwestern Pipeline Company, a Delaware corporation having its principal place of business in Houston, Texas, is a "natural-gas company" within the meaning of the Natural Gas Act as heretofore found by the Commission in its order of August 10, 1959, in Docket No. G-14871, *et al.* (22 FPC 391).

(2) The proposed sale and delivery of natural gas hereinbefore described, as more fully described in the application in this proceeding, are to be made in interstate commerce, subject to the jurisdiction of the Commission, and are, therefore, subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules, and regulations of the Commission thereunder.

(4) The proposed sale and delivery of natural gas by Applicant, together with any facilities necessary therefor, are required by the public convenience and necessity, and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraph (e) of such Regulations.

(6) The sale hereinafter authorized should be limited to 2,000 Mcf of gas per day.

(7) A request by staff counsel for omission of the intermediate decision procedure herein was unopposed by any party of record and, not having been denied by the Commission, is granted pursuant to Section 1.30 (c) (1) of the Commission's Rules of Practice and Procedure.

The Commission orders:

(A) A certificate of public convenience and necessity be and the same is hereby issued authorizing Applicant, Transwestern Pipeline Company, to sell and deliver up to 2,000 Mcf of interruptible gas per day to Climax Chemical Company, and to construct any facilities necessary therefor, as hereinbefore described, all as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraph (e) of Section 157.20 of such Regulations.

Before Commissioners: Joseph C. Swidler, Chairman, Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

J. RAY McDERMOTT & COMPANY, INC., *ET AL.*, DOCKET NO. G-19873

ORDER DENYING MOTION TO TERMINATE PROCEEDING IN PART

(Issued June 18, 1962)

On September 30, 1959, J. Ray McDermott & Company, Inc., *et al.*, (McDermott) filed two notices of change in its effective rate schedules relating to gas produced in the Plymouth and W. Callaboose Fields, San Patricio County, Texas, and the Red Fish Bay Field, Nueces County, Texas, and sold to Tennessee Gas Transmission Company. By order issued October 23, 1959, said tenders, which would increase the level of rate from 12.12268¢ to 15.0952¢ per Mcf, were designated as Supplement No. 7 to McDermott's FPC Gas Rate Schedules Nos. 7 and 5, respectively, and were suspended until April 1, 1960, and thereafter until each is made effective in the manner prescribed by the Natural Gas Act. Upon proper motion said increased rates became effective as of that date subject to further orders in this proceeding.

On January 9, 1961, the Estate of Herman F. Heep and Mrs. Minnie Belle Heep (Heep) [1] tendered a motion seeking modification of the aforesaid suspension order issued October 23, 1959, as to their interests to provide that the suspension of that portion of the *rate increase* which does not exceed 14¢ per Mcf be terminated. In support of the motion, Heep states that the Commission's *Statement of General Policy No. 61–1*, 24 FPC 818, establishes 14¢ per Mcf as the area price for the two counties here involved; and requests that the Commission's order issued October 23, 1959, suspending the entire rate increase, be modified so that the suspension of that portion of the rate increase which does not exceed 14¢ per Mcf be terminated effective as of the date of receipt by the Commission of said motion, and that Heep be allowed to collect such part of the increased rate not exceeding 14¢ per Mcf unconditionally and without obligation to refund.

As we have stated before, the rate levels shown in the aforementioned *Statement of General Policy* are merely 'to serve as a guide' in determining 'just and reasonable' rates. They are not determinative of the 'just and reasonable' rates for the various areas. Neither are they to be considered as floor rates for sales made in the various areas. In fact, it may result that, based on evidence adduced, the just and reasonable rate for the particular sale of gas may be below that set out in our Statement of General Policy for the producing area wherein the sale is made. *Humble Oil & Refining Company*, Docket No. G–17144, Order Denying Motion to Make Effective Without Obligation to Refund a Portion of Proposed Increased Rates, issued June 19, 1961, 25 FPC 1173, and *S. W. Richardson*, Docket No. RI61–280, Order Denying Motion for Modification of Order Suspending Increased Rate, issued June 19, 1961, 25 FPC 1177.

The Commission finds:

That for the reasons heretofore stated, it is in the public interest and necessary in the proper enforcement of the Natural Gas Act, that Heep's aforesaid motion to partially terminate this proceeding be denied.

The Commission orders:

Heep's motion to terminate this proceeding insofar as the proceeding pertains to that portion of the increased rate not in excess of 14¢ per Mcf is hereby denied.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

J. RAY McDERMOTT & COMPANY, INC., *ET AL.*, DOCKET NO. RI60–383

ORDER DENYING MOTION TO TERMINATE SUSPENSION PROCEEDING IN PART

(Issued June 18, 1962)

On May 12, 1960, J. Ray McDermott & Company, Inc., *et al.*, (McDermott) filed a notice of change in its effective rate schedule relating to gas produced in the Mustang and Red Fish Bay Fields, Nueces and San Patricio Counties, Texas, and sold to United Gas Pipe Line Company. By order issued herein on June 8, 1960, said tender, which would increase the level of rate from 12.66¢ to 14.8¢ per Mcf, was designated as Supplement No. 8 to McDermott's FPC Gas Rate Schedule No. 8 and was suspended until November 12, 1960, and there-

[1] McDermott by letter dated May 24, 1960, advised the Commission that the Estate and Mrs. Heep each retain 7.29165% of interest in the production sold pursuant to its FPC Gas Rate Schedule No. 5 and 25% pursuant to its FPC Gas Rate Schedule No. 7.

after until it is made effective in the manner prescribed by the Natural Gas Act.

On January 9, 1961, the Estate of Herman F. Heep and Mrs. Minnie Belle Heep (Heep) [1] filed a motion seeking modification of the aforementioned suspension order issued June 8, 1960, as to their interests, to provide that the suspension of that portion of the rate increase which does not exceed 14¢ per Mcf be terminated. In support of their motion, Heep states that the Commission's *Statement of General Policy No. 61–1*, as amended, establishes 14¢ per Mcf as the area price for the two counties involved; and requests that the Commission's order issued June 8, 1960, suspending the entire rate increase filed by McDermott, be modified so that the suspension of that portion of the rate increase which does not exceed 14¢ per Mcf be terminated effective as of the date of receipt by the Commission of said motion, and that Heep be allowed to collect such part of the increased rate not exceeding 14¢ per Mcf unconditionally and without obligation to refund.

As we have stated before, the rate levels set out in our *Statement of General Policy No. 61–1* are merely 'to serve as a guide' in determining 'just and reasonable' rates. They are not determinative of the 'just and reasonable' rates for the various areas. Neither are they to be considered as floor rates for sales made in the various areas. In fact, it may result that, based on evidence adduced, the just and reasonable rate for the particular sale of gas may be below that set out in our Statement of General Policy for the producing area wherein the sale is made. *Humble Oil & Refining Company*, Docket No. G–17144, Order Denying Motion to Make Effective Without Obligation to Refund a Portion of Proposed Increased Rates, issued June 19, 1961, 25 FPC 1173, and *S. W. Richardson*, Docket No. RI61–280, Order Denying Motion for Modification of Order Suspending Increased Rate, issued June 19, 1961, 25 FPC 1177.

The Commission finds:

For the reasons heretofore stated, it is in the public interest and necessary in the proper enforcement of the Natural Gas Act that Heep's aforesaid motion to partially terminate this proceeding be denied.

The Commission orders:

Heep's motion to terminate this proceeding insofar as the proceeding pertains to that portion of the increased rate not in excess of 14¢ per Mcf is hereby denied.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

AMENDMENT OF PART 1, RULES OF PRACTICE AND PROCEDURE, RELATING TO INTERVENTION AND APPLICATIONS FOR REHEARING AND PART 157, REGULATIONS UNDER THE NATURAL GAS ACT, RELATING TO TEMPORARY SERVICE BY PRODUCERS, DOCKET NO. R–219

ORDER NO. 251

MISCELLANEOUS AMENDMENTS

(Issued June 18, 1962) *

The Commission has under consideration in this proceeding the amendment of its rules of practice relating to intervention [18 CFR 1.8] and applications

[1] Party sellers under the rate schedule involved in this proceeding.

* Published in the Federal Register on June 19, 1962, (27 F.R. 5766)

for rehearing [18 CFR 1.34] and its regulations under the Natural Gas Act with respect to authorizations for temporary service by independent producers [18 CFR 157.28]. The amendments are unrelated.

1. The Commission, in the past, has permitted persons or municipalities engaged in local distribution of natural gas to intervene in both certificate and rate proceedings for the purpose of obtaining, pursuant to section 7 (a) of the Natural Gas Act, an order from the Commission directing the applicant or respondent pipeline company to interconnect its facilities with and sell natural gas to the municipality or distribution company. Part 156 of the Regulations Under the Natural Gas Act [18 CFR, Part 156] sets forth the requirements with which applicants (as distinguished from those petitioning for intervention) for a section 7 (a) order must comply. Obviously, the Commission needs the same information to determine whether such an order should be issued irrespective of whether the request is made by application under Part 156 or in a petition to intervene. Accordingly, we are amending the intervention rule to require petitioners thereunder to comply with Part 156 when the purpose of the requested intervention is to obtain a section 7 (a) order.

2. Section 1.34 of the rules of practice sets out the requirements to be followed in making applications for rehearing pursuant to sections 313 (a) of the Federal Power Act and 19 (a) of the Natural Gas Act, respectively. The rule makes no provision for the filing of an answer to such an application and we are not now providing for one.

We believe, however, that if rehearing is granted a pleading in the nature of an answer would serve to more clearly define the issues and enable parties and staff counsel to present their positions on the issues upon which rehearing has been granted to the Commission. We are therefore amending section 1.34 to provide for such a pleading.

3. Section 157.28 of the Regulations Under the Natural Gas Act provide a method whereby applications for authority to institute temporary service by independent producers can be processed expeditiously. The benefits of that section are not available under the existing rule "with respect to service proposed to commence more than 30 days from the date of the filing of the statement" required to be filed by the section.

It has been brought to our attention that the pipeline purchaser will often not commence construction of its connecting facilities until the temporary authorization to commence service has been issued and accepted by the producer. Unless the construction required is extremely limited, the time necessary for acceptance and construction can well exceed the thirty-day limitation of the rules. Since the objective of the temporary authorization is to relieve the producer of possible hardship we believe that there should be some time limitation. We are therefore amending the rule to enlarge the limitation to 90 days from the date the authorization is issued by the Commission.

If the applicant in a particular case has reason to believe that a period in excess of 90 days is required he should furnish information in support of such increased period at the time the request for temporary authorization is filed.

For the reasons set forth above, the Commission *finds:*

(1) The amendments ordered herein are appropriate and necessary for carrying out the provisions of the Federal Power and Natural Gas Acts.

(2) The amendments to Part 1, hereinafter adopted pertain to matters of practice and procedure which do not require notice or hearing under section 4 (a) of the Administrative Procedure Act.

(3) Although the amendment to section 157.28 might be construed as involving a matter of substance, prior notice thereof is unnecessary since it relaxes, in effect, the restrictions of the existing rule and provides by general order

requirements which could be imposed by individual order applicable only to the request for temporary authorization particularly involved.

(4) Good cause exists for making the amendments effective as herein ordered. *The Commission*, acting pursuant to sections 308, 309, and 313 of the Federal Power Act (49 Stat. 858, 859, 860, 16 U.S.C. 825g, 825h, 825*l*) and sections 7, 15, 16, and 19 of the Natural Gas Act (56 Stat. 83, 52 Stat. 83, 52 Stat. 829, 830, 831, 15 U.S.C. 717f, 717n, 717o, 717r) *orders:*

(A) Part 1, Rules of Practice and Procedure, Chapter I of Title 18 of the Code of Federal Regulations, is amended as follows:

1. In § 1.8, subsection (c) is amended by adding a proviso at the end of the first sentence and revising the second sentence, to read as follows:

"(c) *Form and contents of petitions.* Petitions to intervene shall set out clearly and concisely the facts from which the nature of the petitioner's alleged right or interest can be determined, the grounds of the proposed intervention, and the position of the petitioner in the proceeding, so as fully and completely to advise the parties and the Commission as to the specific issues of fact or law to be raised or controverted, by admitting, denying or otherwise answering, specifically and in detail, each material allegation of fact or law asserted in the proceeding, and citing by appropriate reference the statutory provisions or other authority relied on: *Provided*, That where the purpose of the proposed intervention is to obtain an allocation of natural gas for sale and distribution by a person or municipality engaged or legally authorized to engage in the local distribution of natural or artificial gas to the public, the petition shall comply with the requirements of Part 156 of this chapter (i.e., Regulations Under the Natural Gas Act). Such petitions shall in other respects comply with the requirements of §§ 1.15 to 1.17, inclusive."

[Authority: Secs. 15, 16, 52 Stat. 829, 830, sec. 7, 56 Stat. 83, 15 U.S.C. 717f, 717n, 717o.]

2. In § 1.34, add a new subsection (d) to read as follows:

"(d) *Response.* No answers to petitions for rehearing will be entertained by the Commission. If, and to the extent, however that rehearing is granted by the Commission, a response in the nature of an answer may be filed by any party or staff counsel within 15 days after the issuance of the order granting rehearing. Such response shall be confined to the issues upon which rehearing has been granted, and shall be served by the proponent upon all parties to the proceeding or their attorneys of record. All such responses shall in all other respects conform to the requirements of §§ 1.15 to 1.17, inclusive."

[Authority: Secs. 308, 309, and 313, 49 Stat. 858, 859, 860, 16 U.S.C. 825g, 825h, 825*l*; secs. 15, 16, and 19, 52 Stat. 829, 830, 831, 15 U.S.C. 717n, 717o, 717r.]

(B) In § 157.28 of Part 157, Regulations Under the Natural Gas Act, Chapter I of Title 18 of the Code of Federal Regulations, paragraph (a) is amended to read as follows:

"(a) It does not apply to termination of any sale or transportation or with respect to service proposed to commence more than 90 days from the date on which the temporary authorization is issued by the Commission unless otherwise ordered for good cause shown."

[Authority: Sec. 16, 52 Stat. 830, sec. 7, 56 Stat. 83, 15 U.S.C. 717f, 717o.]

(C) The amendments prescribed by ordering clause (A) herein are effective upon the issuance of this order.

(D) The amendment to § 157.28 prescribed in ordering clause (B) herein shall be effective July 15, 1962.

(E) The Secretary shall cause prompt publication of this order to be made in the Federal Register.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

UNITED GAS PIPE LINE COMPANY AND TENNESSEE GAS TRANSMISSION COMPANY, DOCKET NO. CP62-213

FINDINGS AND ORDER ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY AND ACCEPTING RATE SCHEDULE FOR FILING

(Issued June 19, 1962)

On March 14, 1962, United Gas Pipe Line Company (United) and Tennessee Gas Transmission Company (Tennessee) (sometimes hereinafter referred to jointly as Applicants) filed in Docket No. CP62-213 a joint application pursuant to Section 7 (c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing Tennessee to deliver natural gas to United up to and including March 31, 1963, in return for equivalent volumes of natural gas delivered by United to Tennessee during the period January 16 to January 29, 1962.

Applicants state that United made the temporary delivery of natural gas to Tennessee as a result of an emergency existing on Tennessee's system and that Applicants seek herein authorization permitting Tennessee to return such gas up to and including March 31, 1963.

No new facilities will be required to make the proposed deliveries.

On February 15, 1962, United filed an agreement, dated January 26, 1962, between Applicants, providing for the subject exchange, as its proposed Rate Schedule X-13 to its FPC Gas Tariff, Original Volume No. 2.

Pursuant to due notice, a public hearing was held in Washington, D. C., on June 7, 1962, respecting the matters involved in and the issues presented by the joint application herein. No petition to intervene or protest to the granting of the application has been received. Staff counsel moved orally at the hearing that the intermediate decision procedure be omitted and that the Commission render a decision herein pursuant to Section 1.30 (c) (1) of the Commission's Rules of Practice and Procedure.

The Commission finds:

(1) Applicant, United Gas Pipe Line Company, a Delaware corporation having its principal place of business in Shreveport, Louisiana, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of January 20, 1942, in Docket No. G-216 (3 FPC 2).

(2) Applicant, Tennessee Gas Transmission Company, a Delaware corporation having its principal place of business in Houston, Texas, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of July 12, 1947, in Docket No. G-910 (6 FPC 777).

(3) The return deliveries of emergency gas by Tennessee to United hereinbefore described, as more fully described in the application in this proceeding,

are to be made in interstate commerce, subject to the jurisdiction of the Commission and such deliveries by Tennessee are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(4) Applicants are able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(5) The proposed return deliveries of emergency gas by Tennessee to United are required by the public convenience and necessity and a certificate therefor should be issued as hereinafter ordered and conditioned.

(6) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicants' compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (c) (3) and (e) of Section 157.20 of such Regulations.

(7) The agreement, dated January 26, 1962, filed on February 15, 1962, by United should be accepted for filing as Rate Schedule X–13 to United's FPC Gas Tariff, Original Volume No. 2, to become effective on the date this order issues.

(8) The certificate hereinafter issued should be conditioned upon Tennessee filing, in accordance with the requirements of Part 154 of the Commission's Regulations under the Natural Gas Act, a rate schedule similar to that filed by United as United's Rate Schedule X–13.

(9) A request during the public hearing by staff counsel for omission of the intermediate decision procedure herein was unopposed by any party of record and, not having been denied by the Commission, is granted pursuant to Section 1.30 (c) (1) of the Commission's Rules of Practice and Procedure.

The Commission orders:

(A) A certificate of public convenience and necessity be and the same is hereby issued jointly to Applicants, United Gas Pipe Line Company and Tennessee Gas Transmission Company, authorizing Tennessee to deliver and return to United the emergency gas delivered by United at any time up to and including March 31, 1963, as hereinbefore described, all as more fully described in the joint application herein, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicants' compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (c) (3) and (e) of Section 157.20 of such Regulations.

(C) The agreement, dated January 26, 1962, filed on February 15, 1962, by United is hereby accepted for filing as Rate Schedule X–13 to United's FPC Gas Tariff, Original Volume No. 2, to become effective on the date this order issues.

(D) The certificate issued by paragraph (A) above is hereby conditioned upon Tennessee filing, in accordance with the requirements of Part 154 of the Commission's Regulations under the Natural Gas Act, a rate schedule similar to that filed by United as United's Rate Schedule X–13.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

EL PASO NATURAL GAS COMPANY, DOCKET NO. CP62-64

FINDING AND ORDER AMENDING ORDER ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued June 20, 1962)

On April 23, 1962, El Paso Natural Gas Company (Petitioner) filed in Docket No. CP62-64 a petition to amend the certificate order in said docket issued December 12, 1961, 26 FPC 836, by authorizing the construction and operation of three additional lateral pipelines to sell and deliver natural gas to The Washington Water Power Company for resale and distribution in Rosalia, St. John, and LaCrosse, Washington, all as more fully set forth in the petition.

Petitioner has already installed one lateral line pursuant to the authorization granted in the instant docket and presently has pending requests for four more lines including those which are the subject of the present petition. The facilities required to serve the three communities herein are 2.0 miles of 2⅜" O.D. pipeline for Rosalia at an estimated cost of $23,054, 1.3 miles of 2⅜" O.D. pipeline for St. John at an estimated cost of $15,179, and 0.9 miles of 2⅜" O.D. pipeline for LaCrosse at an estimated cost of $10,679. The facilities will be constructed along the transmission system of Pacific Gas Transmission Company.

Petitioner does not seek authorization to construct and operate facilities in excess of the cost and volumetric limitations set forth in the order of December 12, 1961.

Notice of the petition was published in the Federal Register on May 18, 1962 (27 FR 4744). No protest, request for hearing, or petition to intervene has been received.

The Commission finds:

It is appropriate in carrying out the provisions of the Natural Gas Act and required by the public convenience and necessity that the certificate order issued December 12, 1961, in Docket No. CP62-64 should be amended to authorize the construction and operation of additional facilities as hereinbefore described and as more fully described in the petition herein.

The Commission orders:

(A) The order issued on December 12, 1961, in Docket No. CP62-64 be and the same is hereby amended to authorize the construction and operation of additional facilities as hereinbefore described and as more fully described in the petition herein.

(2) In all other respects, including cost and volumetric limitations, the order issued December 12, 1961, shall remain in full force and effect.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

UNION ELECTRIC COMPANY, DOCKET NO. E-6927

ORDER DENYING APPLICATION FOR REHEARING

(Issued June 20, 1962)

On May 21, 1962, Union Electric Company filed application for rehearing of the Commission's Opinion No. 356 and Order Upon a Declaration of Intention, issued April 19, 1962, in the above-entitled proceeding [27 FPC 801]. The Presiding Examiner at the original hearing had found that the proposed Taum Sauk project in the State of Missouri would be capable of affecting, and would, at times, affect the navigable capacity of the Black River which is a navigable waterway of the United States, and therefore, was required to be licensed under the Federal Power Act. The Commission adopted his findings and conclusions in this regard. In addition, the Examiner found that the proposed project will be constructed, operated and maintained for the development of power to supply markets outside the State of Missouri, thereby affecting the interests of interstate commerce. The Commission adopted this finding also and held that the development, transmission and utilization of this power in interstate commerce will have such an effect upon the interests of interstate commerce that a hydroelectric project proposing to use the Nation's water resources for this purpose is required to be licensed under the Federal Power Act.

In Opinion No. 356, the Commission held that it had the duty under the Federal Power Act, when the use of the Nation's water resources is proposed for hydroelectric power development, to assure that the most beneficial and comprehensive use of those resources is achieved and protected in the interests of the Nation as a whole. When the interests of interstate commerce will be affected by such a project, even if navigation were not affected, the Commission held that the same duty applied.

The Commission finds:

The grounds for rehearing contained in the application for rehearing set forth no new facts or principles of law which were not fully considered by the Commission when it issued its opinion and order on April 19, 1962, or which, having now been considered, warrant any modification of the said opinion and order.

The Commission orders:

The above-mentioned application for rehearing of the Commission's Opinion No. 356 and Order issued April 19, 1962 in this proceeding is hereby denied.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

PACIFIC POWER & LIGHT COMPANY, PROJECT NO. 2082

ORDER APPROVING PROJECT EXHIBITS AND ADJUSTING ANNUAL CHARGES

(Issued June 21, 1962)

On June 14, 1960, Pacific Power & Light Company, licensee for major Project No. 2082, filed for Commission approval Exhibits J and K showing the project area and boundary of the existing developments of the project.

The effect of approval of Exhibit K will be to establish the project area and will result in an increase of 38.08 acres of lands of the United States occupied by the project under license and an increase of $76.16 in the amount of annual charges under the Federal Power Act.

The annual charge for the use of United States lands presently included in the license is $456.64. Inclusion of the additional lands in the project will increase the charge to $532.80, effective as of March 1, 1956, the date on which the existing developments occupling such lands were included in the license.

The Commission finds:

(1) Exhibit J (FPC No. 2082–120) and Exhibit K (FPC No. 2082–121 through–125) conform to the Commission's rules and regulations and should be approved as part of the license for the project, and Exhibit J (FPC No. 2082–77), now part of the license and which is superseded, should be eliminated from the license.

(2) The increased amount of annual charges to be paid under the license for the purpose of recompensing the United States for the use, occupancy, and enjoyment of its lands, exclusive of those lands used for transmission-line right-of-way, is reasonable as hereinafter fixed and specified.

The Commission orders:

(A) The exhibits described in finding (1) above as conforming to the Commission's rules and regulations are approved as part of the license for the project, and the exhibit described in the same finding as being superseded is eliminated from the license for the project.

(B) Subparagraph (b) of Article 35 of the license is amended to read as follows:

(b) For the purpose of recompensing the United States for the use, occupancy, and enjoyment of its lands, exclusive of those used for transmission line right-of-way, $532.80, effective as of March 1, 1956.

(C) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313 (a) of the Federal Power Act and failure to file such an application shall constitute acceptance of this order. In acknowledgment of the acceptance of this order, it shall be signed for the licensee and returned to the Commission within 60 days from the date of its issuance.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

FLORIDA GAS TRANSMISSION COMPANY, DOCKET NO. CP62–257

FINDINGS AND ORDER ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued June 22, 1962)

On May 7, 1962, Florida Gas Transmission Company (Applicant) filed in Docket No. CP62–257 an application pursuant to Section 7(c) of the Natural Gas Act, for a certificate of public convenience and necessity seeking authorization to construct and operate approximately 0.2 mile of 2⅜-inch O.D. lateral pipeline extending from a point on its 20-inch mainline at a point near Holapaw, Osceola County, Florida, in a general southwesterly direction to a point adjacent to the hay drying plant of Cattle Marketers, Inc. (Marketers), together

with a meter and regulator station, and to sell and deliver natural gas to Marketers on a direct sale preferred interruptible basis, all as more fully set forth in the application.

The natural gas will be used by Marketers in its process of drying hay by means of a gas-fired continuous felt type drier.

It appears that Applicant has sufficient capacity to sell and deliver the natural gas requirements of Marketers without affecting its ability to continue present service to any existing customers on its interstate natural gas transmission system.

Applicant estimates that the average annual deliveries to Marketers will be approximately 275,000 M²btu. The cost of constructing the proposed facilities is $11,600 which cost will be paid by Marketers.

Pursuant to due notice, a public hearing was held in Washington, D. C., on June 19, 1962, respecting the matters involved in and the issues presented by the application in this proceeding. No protest or petition to intervene has been filed. Staff counsel moved orally at the hearing that the intermediate decision procedure be omitted and that the Commission render a decision herein pursuant to Section 1.30 (c) (1) of the Commission's Rule of Practice and Procedure.

The Commission finds:

(1) Applicant, Florida Gas Transmission Company, a Delaware corporation having its principal place of business in St. Petersburg, Florida, is a "natural-gas company" within the meaning of the Natural Gas Act as successor in interest to Houston Texas Gas and Oil Corporation as provided by order of the Commission in Docket Nos. G–9262, *et al.*, issued on April 18, 1962.

(2) The facilities hereinbefore described, as more fully described in the application in this proceeding, are to be used in the transportation and delivery of natural gas in interstate commerce, subject to the jurisdiction of the Commission, as integral parts of Applicant's existing system, and the construction and operation thereof by Applicant are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(4) The construction and operation of the facilities and the delivery of natural gas as proposed by Applicant herein are required by the public convenience and necessity and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c) (3), (c) (4) and (e) of Section 157.20 of such Regulations, and that the construction of the facilities authorized by this order should be completed and said facilities placed in actual operation within six months from the date on which this order issues.

(6) The volume of natural gas to be delivered by Applicant to Cattle Marketers, Inc. pursuant to the authorization hereinafter granted should be limited to not more than 275,000 M²Btu (Mcf at 1000 Btu per cubic foot) per year.

(7) A request during the public hearing by staff counsel for omission of the intermediate decision herein was unopposed by any party of record and, not

having been denied by the Commission, is granted pursuant to Section 1.30 (c) (1) of the Commission's Rules of Practice and Procedure.

The Commission orders:

(A) A certificate of public convenience and necessity be and the same is hereby issued authorizing Florida Gas Transmission Company to construct and operate the facilities and to deliver natural gas as hereinbefore described, as more full described in the application in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c) (3), (c) (4) and (e) of Section 157.20 of such Regulations.

(C) The construction of the facilities authorized by this order shall be completed and said facilities placed in actual operation within six months from the date on which this order issues.

(D) The volume of natural gas to be delivered by Florida Gas Transmission Company to Cattle Marketers, Inc. under this authorization is hereby limited to not more than 275,000 M^2Btu (Mcf at 1000 Btu per cubic foot) per year.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

EL PASO NATURAL GAS COMPANY, DOCKET NOS. G–4769, G–12948, G–17929, AND RP60–3

ORDER AFFIRMING RULING OF PRESIDING EXAMINER

(Issued June 26, 1962)*

This matter is before us on appeal by the El Paso Natural Gas Company (El Paso) from the Presiding Examiner's ruling at the hearing on June 4, 1962, sustaining objections to El Paso's proposed rebuttal Exhibits Nos. 130 and 131 entitled, respectively "El Paso Natural Gas Company, Cost of Service Study—Docket No. RP60–3, 17 months ended December 31, 1961" and "El Paso Natural Gas Company, Cost of Service Study—Docket No. RP60–3, Calendar Year 1961, Adjusted for Known Changes," and to the proposed rebuttal testimony related thereto, and excluding said exhibits and striking said testimony from the record. The objections to the proposed testimony and exhibits, were filed by the California Public Utilities Commission, Southern California Gas Company and Southern Counties Gas Company, Pacific Gas and Electric Company, the City and County of San Francisco and the Commission Staff. Replies to these objections were filed by Washington Natural Gas Company, Northwest Natural Gas Company, Arizona Public Service Company and El Paso Natural Gas Company. The portion of the record pertinent to the issue herein involved has been certified to us by the Presiding Examiner.

We agree with the Presiding Examiner that the question presented here is governed by the Commission's order in *Texas Gas Transmission Corporation*, Docket No. RP61–15 [September 8, 1961, 26 FPC 479], wherein the Commission held:

---

*Order issued August 15, 1962 denying reconsideration, 28 FPC 325. Petition for Review dismissed, El Paso Natural Gas Co. v. F.P.C. (CA5 No. 20041).

We believe that once a company has selected a test period either for use in settlement conferences or for presentation in a formal proceeding, the subsequent adoption of this same test period by the staff and the preparation of Staff's case in reliance thereon are matters affecting the public interest. In such circumstances, any unilateral departure from the selected test period must be supported by reasons of compelling nature. We ing test period must be supported by reasons of compelling nature. We do not believe that the facts of this particular case warrant such a unilateral departure.

We, therefore, find that the appeal by Commission Staff should be upheld, the ruling of the presiding examiner set aside, and that the testimony and exhibits admitted in evidence by the examiner should be stricken from the record of this proceeding.

The acceptance of the proposed testimony and exhibits would reopen these proceedings for the purpose of retrying Docket No. RP60–3 on the basis of the costs and revenues shown in Exhibits 130 and 131 for test periods different from that used by El Paso and the Commission staff in the proceedings in that docket. We do not believe this to be in the public interest. The public interest requires the orderly administration of regulation. This means, *inter alia*, that at some point in the regulatory process litigation must terminate. *Interstate Commerce Commission* v. *Jersey City*, 322 U.S. 503, 514; *El Paso Natural Gas Co.* v. *F.P.C.*, 281 F. 2d 567, 574.

The Commission orders:

The appeal of the El Paso Natural Gas Company from the Presiding Examiner's ruling of June 4, 1962, sustaining objections to Exhibits Nos. 130 and 131 and the testimony relating thereto and excluding said exhibits and striking said testimony from the record is hereby denied, and the Presiding Examiner's ruling thereon is hereby affirmed.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

SIERRA PACIFIC POWER COMPANY, DOCKET NO. E–7031

SUPPLEMENTAL ORDER AUTHORIZING THE ISSUANCE OF FIRST MORTGAGE BONDS

(Issued June 26, 1962)

By order issued June 14, 1962, 27 FPC 1252, in the above-entitled matter, the Commission authorized Sierra Pacific Power Company (Applicant) to issue and sell at competitive bidding $5,000,000 principal amount of First Mortgage Bonds, due 1992, subject to the provisions, among others, set forth in Paragraph (B) of that order, as follows:

(B) The proposed issuance and sale of Bonds at competitive bidding shall not be consummated until:

(i) Applicant shall have amended its application pursuant to the requirements of Section 34.2 (k) (3) of the Commission's Regulations under the Federal Power Act relating to compliance with competitive bidding requirements, and Section 34.2 (k) (4) of those Regulations relating to affiliation, and shall have either filed such amendments or shall have mailed them and advised the Commission by telephone and telegraph, as contemplated in Section 34.9 of the Regulations.

(ii) The Commission, by further order, shall have approved the price to be received by Applicant for the proposed issuance of Bonds and the interest rate thereof.

Applicant, on June 26, 1962, filed an amendment, pursuant to the requirements of the afore-mentioned Commission order, setting forth, among other things, that it proposes to accept, as providing the lowest annual cost of money to it, the bid of Halsey Stuart & Co. Inc. to purchase the proposed issuance of $5,000,000 principal amount of Bonds, for the price of 101.05% of principal amount, with an interest rate of 4⅞%.

The Commission finds:

(1) Applicant has satisfactorily complied with the requirements of paragraph (B) of the Commission's order issued June 14, 1962, in the above docket, and under the bid it proposes to accept for the Bonds, the price to be received by Applicant therefor and the interest rate thereof are reasonable.

(2) The proposed issuance and sale of Bonds, as hereinafter authorized, will be for a lawful object, within the corporate purposes of the Applicant and compatible with the public interest, which is appropriate for and consistent with the proper performance by the Applicant of service as a public utility and which will not impair its ability to perform that service, and is reasonably necessary and appropriate for such purposes.

The Commission orders:

(A) The price to be received by Applicant for the proposed Bonds and the interest rate thereof under the bid referred to above are approved as reasonable.

(B) The proposed issuance and sale of Bonds referred to above, upon the terms and conditions and for the purposes specified in the application, as supplemented by the amendment referred to above, are hereby authorized subject only to the provisions of paragraphs (A), (C), (D), and (E) of the Commission's order issued June 14, 1962 in the above docket.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

EASTERN SHORE NATURAL GAS COMPANY, DOCKET NO. RP61-20

ORDER APPROVING OFFER OF SETTLEMENT

(Issued June 27, 1962)

On January 27, 1961, Eastern Shore Natural Gas Company (Eastern Shore) tendered for filing First Revised Sheet Nos. 5, 8, 11 and 18-A[1] to its FPC Gas Tariff, Original Volume No. 1.

The revised tariff sheets proposed a $7.164 demand charge and a 34¢ commodity charge in both the general service (G-1) rate schedule (Sheet No. 11) and the contract demand (CD-1) rate schedule (Sheets Nos. 5 and 8) and a 34¢ straight rate in the excess gas service (E-1) rate schedule (Sheet No. 18-A). The pre-existing rate levels were as follows: $5.75 demand charge and 32.5¢ commodity charge in both the general service and contract demand rate schedules and 32.5¢ straight rate in the excess gas service rate schedule. Eastern Shore requested that the revised sheets, estimated to increase jurisdic-

[1] A substitute First Revised Sheet No. 18-A was filed on February 6, 1961, to correct an error in the like-numbered sheet filed January 27, 1961.

tional revenues approximately $54,000, be permitted to become effective as of April 17, 1961.[2]

After a suspension by order issued February 24, 1961, in this proceeding, the aforementioned revised tariff sheets became effective as of April 17, 1961, subject to the terms and conditions set out in the order issued herein on May 12, 1961. By order issued May 15, 1961, Pennsylvania and Southern Gas Company (Pennsylvania and Southern) was permitted to intervene.

On April 3, 1962, Eastern Shore submitted a proposed offer of settlement of this proceeding to the parties. Conferences were held thereon and resulted in a "Stipulation of Settlement" which was placed on the record on May 17, 1962 (Tr. 44-46). As requested by Eastern Shore and concurred therein by Staff and Pennsylvania and Southern, the Presiding Examiner on May 22, 1962, certified the settlement proposal to the Commission for its consideration.

The settlement proposal provides (1) that for the period beginning April 17, 1961 and ending February 28, 1962, Eastern Shore shall refund to its customers the difference between the revenues actually collected and those which would have been collected pursuant to a $6.25 per Mcf per month demand charge and a 34¢ per Mcf commodity charge; (2) that for the period beginning March 1, 1962, Eastern Shore shall file revised tariff sheets providing for a $6.60 per Mcf per month demand charge and a 34¢ per Mcf commodity charge; (3) that Eastern Shore shall not file a general increase in rates prior to July 1, 1963, unless Transco increases the rate under its CD-3 rate schedule prior to that date; and (4) that Eastern Shore shall pass on to its customers the proportionate share of any further refunds Eastern Shore may receive from Transco applicable to the period covered by this proceeding.

The aforementioned proposed settlement is based upon a cost-of-service computed by the Staff. All parties to the proceeding have agreed to and signed the Stipulation of Settlement.

The Commission finds:

(1) The increased rates and charges contained in Eastern Shore's First Revised Sheet Nos. 5, 8 and 11 to its FPC Gas Tariff, Original Volume No. 1, have not been shown to be just and reasonable or otherwise lawful under the provisions of the Natural Gas Act, and should be disallowed as hereinafter provided and ordered.

(2) The settlement proposal referred to above is in the public interest and should be approved as hereinafter provided.

(3) Good cause exists for waiving the 30-day notice requirement provided in Section 154.22 of the Commission's Regulations under Natural Gas Act so that the revised tariff sheets under the proposed settlement agreement may become effective as of March 1, 1962, as hereinafter ordered.

The Commission orders:

(A) The increased rates and charges contained in Eastern Shore's First Revised Sheet Nos. 5, 8 and 11 to its FPC Gas Tariff Original Volume No. 1, are disallowed and denied.

(B) The rate for excess gas in Eastern Shore's First Revised Sheet No. 18-A to its FPC Gas Tariff, Original Volume No. 1, is hereby permitted to continue in effect without obligation to refund.

(C) Within 30 days from the date of this order, Eastern Shore shall file revised tariff sheets to its FPC Gas Tariff, Original Volume No. 1, in accordance

[2] The date to which Eastern Shore's sole supplier's (Transcontinental Gas Pipe Line Company's) proposed rate increase was suspended in Docket No. RP61-13. Transco's rate levels in that proceeding were subsequently determined by order issued February 2, 1962, 27 FPC 187.

with the provisions of the settlement agreement, subject to approval of the Commission.

(D) The 30-day notice provision in Section 154.22 of the Regulations under the Natural Gas Act is hereby waived and the revised tariff sheets filed pursuant to paragraph (C) are hereby permitted to become effective as of March 1, 1962, subject to the terms and conditions of this order and of the settlement proposal as set out in the record of this proceeding.

(E) Within 45 days from the date of this order, Eastern Shore shall refund the difference between the revenues actually collected from and after April 17, 1961, and those which would have been collected pursuant to the rates set out in the settlement agreement, plus interest at 7% per annum, from the date of payment of such excess until the date of refund.

(F) In the event Eastern Shore receives refunds from Transco for gas purchased by it from and after April 17, 1961, to and including the date of this order, Eastern Shore shall make further refunds, including interest, to its jurisdictional customers consistent with Article 4 (Tr. 45) of the settlement agreement.

(G) Within 15 days after refunding the excess revenues required by paragraphs (E) and (F), Eastern Shore shall report to the Commission, in writing and under oath, the amount of the refund made, showing separately the amount of principal and interest so paid, and shall serve a copy of such report upon each of its jurisdictional customers. Concurrently, therewith, Eastern Shore shall file with the Commission a release from each such jurisdictional customer, which shows the receipt of the aforementioned principal and interest.

(H) Upon full compliance by Eastern Shore with all the terms and conditions of this order, and acceptance by the Commission of the rate filing required by paragraph (C) this proceeding shall be considered terminated, subject only to the requirements of paragraph (F) above.

(I) This order is without prejudice to any findings or orders which have been or may hereafter be made by the Commission and is without prejudice to any claims or contentions which may be made by the Commission, the Commission Staff, Eastern Shore, or any other party affected by this order, in any proceeding now pending or hereafter instituted by or against Eastern Shore or any other company, person or party affected by this order.

Before Commissioners: Joseph C. Swidler, Chairman; Howard Morgan, L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

ORDER APPROVING GENERAL RATE SETTLEMENT PROPOSAL AND TERMINATING PROCEEDINGS

(Issued June 28, 1962)*

On May 7, 1962, The Ohio Oil Company (Ohio Oil) filed a petition requesting that the Commission issue an order approving a settlement proposal con-

*Clarifying order issued July 31, 1962, 28 FPC 254.

cerning the rates under 49 of its rate schedules[1] and the above related rate proceedings. The settlement proposal (attached hereto as an Appendix)* was served upon all parties to the above proceedings and was presented on May 7, 1962, to the Presiding Examiner in the rate hearings in Docket Nos. RI60–92, *et al.*[2] Philadelphia Electric Company, Public Service Electric and Gas Company, Long Island Lighting Company, and United Gas Improvement Company—active interveners in said hearings—made comments on the record at the session of May 7, 1962. On May 9, 1962, the Presiding Examiner certified to the Commission Ohio Oil's petition and settlement proposal and the transcript of the May 7 hearing. No one has objected to the settlement proposal.

The settlement proposal provides for (1) rates generally at or below applicable area ceilings, (2) an eighteen month moratorium on rate filings above ceiling,[3] and (3) waiver of the right to file for rate increases under favored-nation pricing provisions in two rate schedules. Ohio Oil submits the proposal on condition that the general rate investigation in Docket No. RI60–92 and the suspension proceedings listed above be terminated without requirement of refunds.

In support of the proposal, Ohio Oil states that the settlement disposes of most of its rate dockets without the necessity of prolonged and costly proceedings, that the moratorium and the waiver of certain favored-nation rights will provide an extended period of price stability and will reduce the number of Ohio Oil's rate filings and suspension proceedings, and that the subject rates will, with two exceptions, conform to established area rate patterns.

One settlement rate which exceeds the applicable ceiling is the increased rate of 16.25¢ plus 1.75¢ tax reimbursement under Rate Schedule No. 15 for a substantial sale of gas to United Gas Pipe Line Company from Duck Land Field, St. Martin and St. Mary Parishes, South Louisiana. The ceiling for increased rates in the area is 14.0¢ plus tax reimbursement (15.75¢ for this sale). In support of the proposed settlement rate, Ohio Oil states that the sale "involves the delivery of gathered, compressed and dehydrated gas under difficult and expensive circumstances . . . in a virtually impenetrable jungle-like wooded area, which is almost completely inundated at all times . . . The problems encountered in the operation of the field are thus more formidable and involve greater expense than is the case in other south Louisiana marshland fields." However, as we have recently noted, the in-line price in each area is determined at the customary point of delivery in that area. *Standard Oil Company of California, et al.*, Docket Nos. CI60–333, *et al.* (Opinion No. 359), issued June 11, 1962, 27 FPC 1153 at 1159. Ohio Oil's incurrence of additional expense does not show service beyond the customary point of delivery in the area.

But we find the proposed settlement rate under Rate Schedule No. 15 acceptable for other reasons. The basic contract, dated August 1, 1952, pro-

[1] Most of Ohio Oil's other rate schedules, not subject to the settlement proposal, will be subject to determinations in Docket Nos. AR61–1, *et al.*, or are rate schedules recently succeeded to by Ohio Oil from Plymouth Oil Company.

* Omitted in printing.

[2] Hearings commenced on September 13, 1960, in the general rate investigation in Docket No. RI60–92 and the consolidated suspension proceedings in Docket Nos. G–12037 through G–20185 listed above. Settlement negotiations commenced on March 5, 1962, upon the suggestion of the Presiding Examiner and were culminated by the presentation of the settlement proposal at the final hearing session on May 7, 1962. No briefs have been filed in the proceedings, nor has an Examiner's decision been issued therein.

[3] Ohio Oil reserves the right to file during the moratorium for increases up to applicable increased rate ceilings except that under Rate Schedule No. 10 Ohio Oil may file for increases only up to the 14.0¢ ceiling might otherwise be applicable.

vided for an initial price of 11.5¢ plus tax reimbursement, with subsequent periodic escalations. No sales were made under the contract until after the pricing provisions were renegotiated. As a result of renegotiation provision was made for a fixed escalation to 20.2¢ per Mcf to become effective soon after the commencement of deliveries. Under these unusual circumstances, the increased price may here be considered in the nature of an initial price and is, at the proposed settlement level, compatible with the initial rate ceiling. We shall therefore approve the proposed settlement rate.

The other settlement rate which exceeds the applicable ceiling is the increased rate of 17.0¢ including tax reimbursement under Rate Schedule No. 56 for a small sale of gas from Barby Ranch Unit (Tract 12), Panhandle Area, Oklahoma. The ceiling for increased rates in the area is 11.0¢ including tax reimbursement. In support of the proposed settlement rate Ohio Oil states as follows: Ohio Oil's lease is on state property and was, according to state rules, subject to cancellation unless a prompt sale of gas was negotiated. Ohio Oil therefore made a one-year temporary sale at 15.0¢ per Mcf while other leaseholders in the unit—whose leases were not subject to short cancellation by their private landowners—were still trying to negotiate sales of gas at 17.0¢. When the others finally made their sale Ohio Oil adopted the permanent gas sales contract executed by the operator of the unit, thereby obtaining an increase in price from 15.0¢ under the temporary contract to 17.0¢ under the adopted superseding permanent contract. Although the 17.0¢ rate was suspended and later made effective subject to refund in Docket No. RI61–413, under the circumstances it may be deemed in the nature of an initial rate and is, judged accordingly, acceptable as being in line with the applicable 17.0¢ initial ceiling.

As we recently stated, the Commission approves of and wants to encourage settlements which dispose of most of a producer's pending rate problems, which do so in accord with our area rate ceilings,[4] which provide for a reasonable moratorium on increased rate filings, which require refunds where appropriate, which lend certainly to the purchased gas costs of buyers, and which free the producer's revenues from contingencies that inhibit exploratory and developmental activities. *Tidewater Oil Company, et al.*, Docket Nos. G–13310, *et al.*, Order Conditionally Approving General Rate Settlement, issued June 15, 1962, *supra*, P. 1267. We note that no refunds will be made under Ohio Oil's Settlement. However, as stated in its petition, all the cost of service analyses presented in Docket Nos. RI60–92, *et al.*, indicated that Ohio Oil's test year jurisdictional revenues did not exceed jurisdictional costs, and this situation probably continued in subsequent years due to declining volumes. Ohio Oil may therefore be relieved of any obligation to make refunds in the subject proceedings, as provided in the settlement proposal. Otherwise the settlement proposal provides the substantial benefits noted above and is in the public interest and should be approved.

Our approval of the settlement proposal should not be construed as constituting approval of any future rate increases that may be filed under the subject rate schedules and is without prejudice to any findings or orders of the Commission in any further proceedings, including area rate proceedings, involving Ohio Oil's rates and rate schedules.

The Commission finds:

(1) The settlement of the proceedings, listed below, on the basis of the settlement proposal submitted by Ohio Oil is in the public interest in carry-

[4] *Statement of General Policy No. 61–1*, 24 FPC 818, as amended.

ing out the provisions of the Natural Gas Act and should be approved and made effective.

(2) Rates under the rate schedules subject to the settlement should be disallowed to the extent they exceed the settlement rates.

The Commission orders:

(A) The settlement of the proceedings in Docket Nos. RI60-92, G-12037, G-13465, G-13521, G-16671, G-16688, G-17275, G-17986, G-19763, G-20185, RI60-227, RI61-140, RI61-413, RI61-481, RI61-521, and RI62-80 on the basis of the settlement proposal attached hereto as the Appendix is approved and made effective.

(B) Rates under the rate schedules subject to the settlement are hereby disallowed to the extent they exceed the settlement rates listed in Column 5 of Exhibit A hereto.

(C) Within 45 days after the date of this order Ohio Oil shall make such filings under its rate schedules as are required to make effective the terms of the settlement proposal.

(D) Upon full compliance by Ohio with all the terms of this order and of the settlement proposal, Ohio Oil shall be relieved of any refund obligations in the proceedings listed in paragraph (A) above and said proceedings shall terminate.

(E) This order is without prejudice to any findings or orders which have been or may be made hereafter by the Commission, and is without prejudice to claims or contentions which may be made by the Commission, Ohio Oil, the Commission staff, or any affected party herein, in any proceedings now pending or hereafter instituted by or against Ohio Oil or any other companies, persons, or parties affected by this order.

AMERICAN LOUISIANA PIPE LINE COMPANY, DOCKET NO. CP62-94; TENSAS GAS GATHERING CORPORATION, DOCKET NO. CP62-127; TEXAS SAN JUAN OIL CORPORATION, DOCKET NO. CI62-382

FINDINGS AND ORDER ISSUING CERTIFICATES OF PUBLIC CONVENIENCE AND NECESSITY

(Issued June 29, 1962)

On October 12, 1961, as supplemented on March 7, 1962, American Louisiana Pipe Line Company (American Louisiana) filed in Docket No. CP62-94 an application pursuant to Section 7(c) of the National Gas Act for a certificate of public convenience and necessity authorizing the construction and operation of approximately 27.1 miles of gathering lines of various diameters, a purchase meter station, and 660 horsepower of field compression facilities to receive natural gas from the Holly Ridge Area of Louisiana and Mississippi, all as more fully set forth in the application as supplemented.

American Louisiana estimates the total cost of the proposed facilities to be $1,125,000, which will be financed from funds on hand.

The proposed facilities will enable American Louisiana to purchase gas from reserves in Tensas, Franklin, Catahoula, and Concordia Parishes, Louisiana, and in Jefferson, Claiborne, and Adams Counties, Mississippi, committed to it under the provisions of a gas purchase contract with Phillips Petroleum Company and G. H. Jett, subsequently assigned to Texas San Juan Oil Corporation (Texas San Juan). The initial rate to be paid under the contract is 17.0 cents per Mcf plus applicable tax reimbursement.

The gas to be purchased will be gathered through the proposed gathering facilities by Texas San Juan and delivered to American Louisiana at a point in Tensas Parish, Louisiana, after processing in Texas San Juan's Locust Ridge Plant. The gas will be transported by Tensas Gas Gathering Corporation

(Tensas) from the Locust Ridge Plant to American Louisiana's 8⅝-inch supply lateral previously authorized in Docket No. CP61–24.

The purchase of gas from the Holly Ridge Area will augment American Louisiana's system gas supply. No new sales are proposed under the subject application, and no increase in the delivery capacity of Applicant's certificated pipeline system is necessary to effectuate the proposal in the subject application.

On October 13, 1961, as supplemented on March 7, 1962, Texas San Juan Oil Corporation filed in Docket No. CI62–382 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the sale of natural gas to American Louisiana after processing in the Locust Ridge Plant, as hereinbefore described, all as more fully described in the application as supplemented.

On November 21, 1961, as supplemented on March 7, 1962, Tensas Gas Gathering Corporation filed in Docket No. CP62–127 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the transportation of natural gas from the outlet of the Locust Ridge Plant to a connection with American Louisiana's 8⅝-inch lateral in Tensas Parish, Louisiana, through Tensas' existing 8-mile, 8-inch pipeline in Tensas Parish, as hereinbefore described, all as more fully described in the application as supplemented.

On April 13, 1962, the Applicants herein were granted temporary authorization to construct and operate the facilities and to render the service proposed.

Pursuant to due notice, a public hearing was held in Washington, D. C. on June 21, 1962, respecting the matters involved in and the issues presented by the applications herein. No protests to the granting of the applications or petitions to intervene have been received. Staff counsel moved orally at the hearing that the intermediate decision procedure be omitted and that the Commission render a decision herein pursuant to Section 1.30 (c) (1) of its Rules of Practice and Procedure.

The Commission finds:

(1) Applicant, American Louisiana Pipe Line Company, a Delaware corporation having its principal place of business in Detroit, Michigan, is a "natural-gas company" within the meaning of the Natural Gas Act as heretofore found by the Commission in its order of October 1, 1954, in Docket No. G–2306, *et al.* (13 FPC 380).

(2) Applicant, Tensas Gas Gathering Corporation, a Louisiana corporation having its principal place of business in Shreveport, Louisiana, is a "natural-gas company" within the meaning of the Natural Gas Act as heretofore found by the Commission in its order of March 31, 1958, in Docket No. G–13588 (19 FPC 411).

(3) Applicant, Texas San Juan Oil Corporation, a Delaware corporation having its principal place of business in Dallas, Texas, is a "natural-gas company" within the meaning of the Natural Gas Act and is engaged in the sale of natural gas in interstate commerce for resale for ultimate public consumption.

(4) The sale of natural gas hereinbefore described, as more fully described in the application, as supplemented, in Docket No. CI62–382, will be made in interstate commerce subject to the jurisdiction of the Commission, and such sale, together with the construction and operation of any facilities subject to the jurisdiction of the Commission necessary therefor, is subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(5) The sale of natural gas by Applicant in Docket No. CI62–382, together with the construction and operation of any facilities subject to the jurisdiction

of the Commission necessary therefor, is required by the public convenience and necessity, and a certificate therefor should be issued as hereinafter ordered and conditioned.

(6) The facilities proposed to be constructed and operated in Docket No. CP62–94 and the transportation of natural gas proposed in Docket No. CP62–127, as hereinbefore described, all as more fully described in the applications in said dockets, are subject to the jurisdiction of the Commission, and the construction and operation of facilities and the transportation of natural gas by the respective Applicants as aforesaid are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(7) Applicants are able and willing properly to do the acts and to perform the services proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules, and regulations of the Commission thereunder.

(8) The construction and operation of facilities and the transportation of natural gas described in paragraph (6) above are required by the public convenience and necessity and certificates therefor should be issued as hereinafter ordered and conditioned.

(9) Public convenience and necessity require that the certificates issued hereinafter in Docket Nos. CP62–94 and CP62–127 and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (b), (c) (3), and (e) of Section 157.20 of such Regulations, and further, the certificate issued hereinafter and Applicant's compliance with paragraph (c) (4) of Section 157.20 of such Regulations.

the rights granted thereunder in Docket No. CP62–94 should be conditioned upon

(10) A request during the public hearing by staff counsel for omission of the intermediate decision procedure herein was unopposed by any party of record and, not having been denied by the Commission, is granted pursuant to Section 1.30(c) (1) of the Commission's Rules of Practice and Procedure.

The Commission orders:

(A) Certificates of public convenience and necessity be and the same are hereby issued authorizing the Applicants in Docket Nos. CP62–94 and CP62–127 to construct and operate facilities and to transport natural gas in interstate commerce, and the Applicant in Docket No. CI62–382 to sell natural gas in interstate commerce for resale, as applied for in the respective applications, as hereinbefore described and as more fully described in said applications, upon the terms and conditions of this order.

(B) The certificates issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicants' compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraph (e) of Section 157.20 of such Regulations, and further the certificates issued by paragraph (A) above in Docket Nos. CP62–94 and CP62–127 and the rights granted thereunder are conditioned upon Applicants' compliance with paragraphs (b) and (c)(3) of Section 157.20 or such Regulations, and the certificate issued in Docket No. CP62–94 and the rights granted thereunder is conditioned upon Applicant's compliance with paragraph (c)(4) of Section 157.20 of such Regulations.

(C) The facilities authorized in Docket No. CP62–94 shall be constructed and placed in actual operation, and the transportation of natural gas authorized in Docket No. CP62–127 shall commence, as provided by paragraph (b) of Section 157.20 of the Commission's Regulations under the Natural Gas Act, within 6 months from the date on which this order issues.

(D) The grant of the certificate issued by paragraph (A) above in Docket No. CI62-382 shall not be construed as waiver of the requirements of Section 4 of the Natural Gas Act or of Part 154 or Part 157 of the Commission's Regulations thereunder, and is without prejudice to any findings or orders which have been or may hereafter be made by the Commission in any proceeding now pending or hereafter instituted by or against the Applicant. Further, our action in this proceeding shall not foreclose nor prejudice any future proceedings or objections relating to the operation of any price or related provisions in the gas purchase contracts herein involved. Nor shall the grant of the certificate aforesaid for service to the particular customer involved imply approval of all the terms of the contract, particularly as to the cessation of service upon termination of said contract, as provided by Section 7(b) of the Natural Gas Act. Nor shall the grant of the certificate aforesaid be construed to preclude the imposition of any sanctions pursuant to the provisions of the Natural Gas Act for the unauthorized commencement of any sales of natural gas subject to said certificate.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

EQUITABLE GAS COMPANY, DOCKET NO. CP62-186

FINDINGS AND ORDER ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued June 29, 1962)

On February 12, 1962, as supplemented on March 12, 1962, Equitable Gas Company (Applicant) filed in Docket No. CP62-186 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction and operation of certain underground gas storage facilities for the operation of Applicant's proposed Mobley Storage Field, located in Wetzel County, West Virginia, all as more fully set forth in the application as supplemented.

The operation of the proposed Mobley Field will provide additional storage capacity for Applicant of approximately 2,500,000 Mcf, and when in full operation the field is expected to permit the withdrawal of approximately 1,500,000 Mcf per heating season. The activation of the Mobley Field and the deliverability available from it will assist Applicant in meeting its increasing requirements, especially its customers' space heating demands during peak periods.

In addition to reconditioning a total of 20 wells for storage, Applicant proposes to construct approximately 9 miles of 12-inch pipeline extending from a point of connection located at its Logansport Storage Pool to a point of connection with its present transmission system, and approximately 3.2 miles of 12-inch pipeline extending from its Logansport Compressor Station to the Mobley Storage Field, together with approximately 5.8 miles of 6-inch and 8-inch well-connecting lines, metering equipment, and yard piping at the Logansport Station.

Applicant plans to develop the Mobley Field as soon as possible so that a portion of the facilities will be in operation during the 1962 injection cycle and to complete the entire project commencing with the 1964 injection season.

The estimated total cost of the proposed facilities is $1,929,240, which will be financed from general funds available to Applicant.

Pursuant to due notice, a public hearing was held in Washington, D. C., on June 12, 1962, respecting the matters involved in and the issues presented by the application herein. No protest to the granting of the application or petition to intervene has been received. Staff counsel moved orally at the hearing that the intermediate decision procedure be omitted and that the Commission render a decision herein pursuant to Section 1.30 (c) (1) of its Rules of Practice and Procedure.

The Commission finds:

(1) Applicant, a Pennsylvania corporation having its principal place of business in Pittsburgh, Pennsylvania, is a "natural-gas company" within the meaning of the Natural Gas Act as heretofore found by the Commission in its order of May 9, 1944, in Docket No. G–275 (4 FPC 588).

(2) The facilities hereinbefore described, as more fully described in the application, as supplemented, in this proceeding, will be used in the transportation and sale of natural gas in interstate commerce subject to the jurisdiction of the Commission, and the construction and operation thereof by Applicant are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules, and regulations of the Commission thereunder.

(4) The proposed construction and operation of facilities are required by the public convenience and necessity, and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c) (3), (c) (4), and (e) of Section 157.20 of such Regulations.

(6) The time within which the facilities should be completed and placed in actual operation should be fixed at 24 months from the date on which this order issues.

(7) The maximum average storage pressure of 800 psig should not be exceeded without further authorization by the Commission.

(8) Applicant should submit semi-annual reports as hereinafter ordered containing information on the characteristics and capabilities of the storage field.

(9) A request during the public hearing by staff counsel for omission of the intermediate decision procedure herein was unopposed by any party of record and, not having been denied by the Commission, is granted pursuant to Section 1.30 (c) (1) of the Commission's Rules of Practice and Procedure.

The Commission orders:

(A) A certificate of public convenience and necessity be and the same is hereby issued authorizing Applicant, Equitable Gas Company, to construct and operate the facilities hereinbefore described, as more fully described in the application, as supplemented, in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder is conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c) (3), (c) (4), and (e) of Section 157.20 of such Regulations.

(C) The time within which the facilities shall be completed and placed in actual operation as provided by paragraph (b) of Section 157.20 of the Commission's Regulations under the Natural Gas Act is hereby fixed at 24 months from the date on which this order issues.

(D) The maximum average storage pressure of 800 psig shall not be exceeded without further authorization by the Commission.

(E) With respect to the Mobley Field, Applicant shall submit semi-annual reports, coinciding with the termination of the input and withdrawal cycles, showing the total volumes of natural gas injected and withdrawn from the field, the shut-in pressure of each well, the average of such pressures, and the corresponding volume of natural gas in the storage reservoir, together with a statement by months of the total volumes of gas injected or withdrawn, the maximum day injection or withdrawal rate experienced, and the average working pressure on such days at a central measuring point at which the total volume is measured. The report shall include additional statements or information that will indicate the pattern of use during the withdrawal cycle. There shall be included with each report a map showing the shut-in pressures in all storage wells and similar pressures in all wells in the area immediately adjacent to the storage field. Reports shall be filed until Applicant has completed two injection and withdrawal cycles when the stabilized shut-in storage pressure after the injection cycle has reached or has closely approximated a maximum storage pressure of 800 psig.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

PANHANDLE EASTERN PIPE LINE COMPANY, DOCKET NO. CP60-103; SHELL OIL COMPANY, DOCKET NO. CI60-660; PIONEER PRODUCTION CORPORATION, DOCKET NO. CI60-689; CALVERT PETROLEUM COMPANY, CI60-691; ASHLAND OIL & REFINING COMPANY, CI60-738; UNION OIL COMPANY OF CALIFORNIA, DOCKET NO. CI60-802; KING-STEVENSON OIL COMPANY, INC., DOCKET NO. CI60-813

ORDER PERMITTING LATE FILING AND ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY NUNC PRO TUNC

(Issued June 29, 1962)

By ordering paragraph (B) of our Opinion No. 350 issued on January 15, 1962, 27 FPC 35, in the above-captioned consolidated proceeding[1] we provided:

(B) Within 30 days from the date of the issuance of this order, Pioneer Production Corporation, Ashland Oil & Refining Company and Union Oil Company of California shall have the option to rescind the cancellation of their contracts with Panhandle and the notices of withdrawal from this proceeding, and to notify the Commission of the resubmittal of their applications on the same terms and conditions originally applied for by them in this proceeding. In the event such resubmission is made, the applications shall be reinstated and certificates shall thereupon be issued, *nunc pro tunc*, to the producer applicants making such resubmission, authorizing the sale of natural gas in interstate commerce as proposed; subject, however, to the same conditions as hereinafter set forth with respect to the other independent producers.

[1] An order clarifying Opinion No. 350 was issued on February 5, 1962, 27 FPC 52.

Pursuant to the aforecited provision, but however not within the time designated, Ashland Oil & Refining Company (Ashland) on February 26, 1962, filed for reinstatement and acceptance, its previously withdrawn application in Docket No. CI60–738 as now amended along with its proposed amended rate schedule. Ashland's application, as originally filed, proposed the sale of gas to Panhandle at an initial price of 17 cents per Mcf to be produced from acreage in the Oklahoma Counties of Woodward, Woods, Major and Dewey. Under the amended application all of the Woodward County acreage has been deleted as well as certain specified acreage in Woods County. In lieu thereof, Ashland has substituted some additional acreage in Woods, Major and Dewey Counties. By its amended rate schedule, designated Ashland Oil & Refining Company FPC Gas Rate Schedule No. 78 along with Supplements Nos. 1 and 2 thereof, Ashland has agreed to an initial price of 15 cents per Mcf at 14.65 psia plus Btu adjustment.

Although Ashland's filing was not made within the time designated and the resubmitted proposal does not encompass "the same terms and conditions originally applied for", *i.e.*, there has been a partial substitution of acreage, neither fact is of sufficient significance so as to warrant rejection of the amended application. In essence, it conforms in full to our ordering paragraph (B) aforecited.

The Commission orders:

(A) Ashland Oil & Refining Company is hereby granted permission to make a filing in accord with Ordering Paragraph (B) of Commission Opinion No. 350 beyond the 30-day period designated therein.

(B) Ashland's amended application filed on February 5, 1962, is hereby accepted for filing. The rate schedule accompanying said amended application is also accepted for filing effective as of the date of initial delivery.

(C) A certificate of public convenience and necessity is hereby issued to Ashland for the sale of gas to Panhandle Eastern Pipe Line Company in accord with the amended application and the rate schedule previously referred to, such certification being subject to all the conditions set forth in our Opinion No. 350 and related clarifying order of February 5, 1962.

(D) The certificate herein issued to Ashland shall be accepted in writing and under oath within 30 days from the date of the issuance of this order.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Conner, Jr., Charles R. Ross and Harold C. Woodward.

THE SUBURBAN FUEL GAS, INC., DOCKET NO. CP62–224

FINDINGS AND ORDER DIRECTING PHYSICAL CONNECTION OF FACILITIES AND SALE OF NATURAL GAS

(Issued June 29, 1962)

On March 28, 1962, as supplemented on April 30, 1962, The Suburban Fuel Gas, Inc. (Applicant) filed in Docket No. CP62–224 an application for an order pursuant to Section 7 (a) of the Natural Gas Act directing The Ohio Fuel Gas Company (Ohio Fuel) to establish physical connection of its transmission facilities with the proposed facilities of and to sell natural gas to Applicant for resale in the villages of Tontogany and Grand Rapids, Wood County, Ohio, and McClure, Henry County, Ohio, and in the vicinity of said villages.

The villages will construct and own their distribution systems as well as 13.7 miles of 6-inch and 6 miles of 4-inch transmission pipeline and related facilities. Applicant, under lease agreements with the villages, will operate all the proposed facilities.

The physical connection of Ohio Fuel's transmission facilities with the facilities of Applicant will be made in Center Township, Wood County, Ohio.

The estimated peak day requirements for the villages total 912 Mcf of natural gas in the third year of service. Total annual requirements are estimated to be 188,000 Mcf in the third year of service.

The total estimated cost of transmission and distribution facilities for the projects aggregate $627,000, which cost will be financed by the villages through local revenue bond issues.

On April 26, 1962, Ohio Fuel filed an answer to the subject application stating that it had no objection to a Commission order directing the sale.

Due notice of the filing of the application and opportunity for hearing thereon has been given by publication in the Federal Register on May 24, 1962 (27 FR 4897). No protest or petition to intervene has been filed in this proceeding.

The Commission finds:

(1) The Ohio Fuel Gas Company, an Ohio corporation having its principal place of business in Columbus, Ohio, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of August 21, 1945, in Docket No. G–371 (4 FPC 1033).

(2) Applicant, The Suburban Fuel Gas, Inc., is an Ohio corporation having its principal place of business in Cygnet, Ohio, and is duly authorized to engage in the business of distributing and selling natural gas within the State of Ohio.

(3) It is necessary and desirable in the public interest that Ohio Fuel be directed to establish physical connection of its natural gas transportation system with the proposed facilities to be operated by Applicant and to sell and deliver natural gas to Applicant, as set forth in the application, as supplemented, and as hereinafter ordered and conditioned. In this connection, Ohio Fuel shall offer Applicant not less than the latter's third year peak day requirement of 912 Mcf.

(4) Applicant should be prepared to receive natural gas from Ohio Fuel within one year of the date of issuance of this order.

(5) The requirement that Ohio Fuel serve Applicant, as proposed, will not place any undue burden upon Ohio Fuel nor impair its ability to render adequate service to its existing customers.

The Commission orders:

(A) The Ohio Fuel Gas Company be and it is hereby directed to establish physical connection of its natural gas transportation system with the proposed facilities to be operated by Applicant and to sell and deliver natural gas to Applicant, all as hereinbefore described and as set forth in the application, as supplemented. Ohio Fuel shall offer Applicant not less than the latter's third year peak day requirement of 912 Mcf.

(B) Applicant shall be prepared to receive natural gas from Ohio Fuel within one year from the date of issuance of this order.

(C) Ohio Fuel shall report to the Commission in writing and under oath the date of commencement of service to Applicant.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Harold C. Woodward.

ORDER DISMISSING REQUESTS MADE PURSUANT TO SECTION 7(F) OF THE ACT AND FIXING DATE OF HEARING

(Issued June 29, 1962)

All of the above-captioned applicants have filed applications requesting that the Commission make a determination pursuant to Section 7(f) of the Natural Gas Act prescribing service areas all as more fully set forth in their applications which are on file with the Commission and open to public inspection.

Applications in the above-captioned dockets were filed on the dates indicated below:

Docket No.	Applicant	Date filed
G–233	United Gas Pipe Line Company	2–11–42
G–235A	Natural Gas Pipeline Company of America	2–23–42
G–253	Arkansas Louisiana Gas Company	4–14–42
G–584	Montana-Dakota Utilities Company	10–7–42
G–643	Northern Natural Gas Company	6–18–45
G–738	Colorado-Wyoming Gas Company	6–17–46
G–758	North Central Gas Company	7–22–46
G–759	Northern Utilities Company	7–22–46
CP62–205	Washington Gas Light Company	2–28–62

Washington Gas Light Company (Washington) is the only applicant who has, within a decade, submitted a filing for a determination under Section 7(f) of the Act. Washington seeks a determination of a service area by the Commission under Section 7(f) of the Act in order to enable it without further authorization of this Commission to enlarge or extend its facilities to meet increased customer requirements within such service area.

The territory which applicant requests the Commission to include in the determination of Applicant's requested service area consists of the following:

The District of Columbia; Montgomery and Prince George's Counties in Maryland; Arlington, Fairfax, Loudoun, and Prince William Counties in Virginia; and all cities now or hereafter existing in Maryland or Virginia within the geographic area bounded by the outer boundaries of the combined area of said counties exclusive, however, of the following areas:

Exclusion 1. The area in Prince George's County, Maryland, known as Laurel Election District Number 10, of Prince George's County, and described more fully in the application.

Exclusion 2. The area in Prince William County, Virginia, known as Dumfries and vicinity, and Quantico Marine Base and territory adjacent thereto along the southern boundary of Prince William County and described more fully in the application.

Washington makes no sales for resale. All the natural gas received by Washington is received within its service area and is ultimately consumed within such area. Washington's rates, service and facilities in the District of Columbia are subject to regulation by the Public Utilities Commission of the District of Columbia; those in Maryland by the Public Service Commission of Maryland; and those in Virginia by the State Corporation Commission of Virginia.

The population of the metropolitan area is continuing to expand and Washington anticipates the continued expansion of business in the Requested Service Area, especially in Maryland and Virginia. In order to meet the requirements of an expanding population it will be necessary for Washington to constantly extend new mains from its present distribution system.

Any extension of service by Washington will be pursuant to and in accordance with the regulations and orders of the respective regulatory commissions of the two states and the District of Columbia. A determination by this Commission puruant to Section 7(f) relative to the service area requested by Washington, will enable that company to extend its presently existing facilities without requiring such extensions to be the subject of duplicative regulation.

An analysis of the applications filed by the other above-captioned applicants makes it manifest that they are not similar to Washington which is primarily a local distributor having no rates subject to federal regulation.

It is also apparent from the language of Section 7(f) of the Act that even after a formal hearing, it is within the discretion of the Commission as to whether or not it should define a service area.

The provisions of Section 7(f) of the Act are as follows:

(f) The Commission, after a hearing had upon its own motion or upon application, may determine the service area to which each authorization under this Section is to be limited. Within such service area as determined by the Commission a natural-gas company may enlarge or extend its facilities for the purpose of supplying increased market demands in such service area without further authorization.

It seems manifest that the restricted application of Section 7(f) of the Act to those facts underlying the Washington filing enables that Section to contribute to the over-all regulatory scheme envisaged by the Natural Gas Act. It is equally apparent that if the Commission in its discretion were to permit other types of applicants, particularly interstate pipelines which perform essentially a transmission service, to invoke the provisions of Section 7(f) of the Act that interminable disputes and long drawn-out hearings of dubious benefit would necessarily ensue.

The Commission finds:

(1) That each of the above-captioned applicants is a natural gas company subject to the provisions of the Natural Gas Act.

(2) That Washington is primarily a distribution company and the extension of its facilities is subject to duplicative regulation by this Commission and by state commissions.

(3) That the public interest may require that in the circumstances applicable to Washington the Commission permit the provisions of Section 7(f) to be invoked.

(4) That the operations of Washington appear to differ in essential respects from those of the above-mentioned applicants.

(5) That formal hearings should be held to determine whether or not the Commission should prescribe a service area for Washington, and, if so, what proper geographical limitations should be accorded such a service area.

736-330—64——90

The Commission orders:

(A) That those applications filed by all of the above-mentioned applicants other than Washington be dismissed.

(B) That pursuant to the authority contained in and subject to the jurisdiction conferred upon the Federal Power Commission by Sections 7 and 15 of the Natural Gas Act, and the Commission's Rules of Practice and Procedure a hearing be held on July 16, 1962 at 10:00 A.M. (EDST), in a hearing room of the Federal Power Commission, 441 G Street, N.W., Washington, D. C., concerning the matters involved in and the issues noted above.

(C) Protests or petitions to intervene may be filed with the Federal Power Commission, Washington 25, D. C., in accordance with the Rules of Practice and Procedure (18 CFR 1.8 or 1.10) on or before July 9, 1962.

PACIFIC POWER AND LIGHT COMPANY, DOCKET NOS. E-7024 and E-7025

[FURTHER DISSENT BY COMMISSIONER MORGAN, ISSUED DECEMBER 7, 1962]*

MORGAN, Commissioner, *dissenting further:*

On March 28, 1962, *supra* p. 623, the Commission published orders in these dockets authorizing, as of that date, the issuance of securities for the purpose of financing a number of projects, including a particular transmission line from Klamath Falls, Oregon to Round Mountain, California which was, and remains, a highly questionable undertaking. Because of the importunities of the applicant and its associates in the financial community, the majority of this Commission were anxious to issue their order on March 28, without waiting for my dissent to be prepared, and as noted in the order I consented to that arrangement.

Because the order was effective as of March 28 and time for appeals for reconsideration or a hearing was running, I prepared my dissent as rapidly as possible, filed it with the Secretary of the Commission on April 3, and on that date distributed copies to the Governors, Senators, Congressmen and Public Utility Commissions of the states involved so that they might have prompt understanding of the important questions bearing on the public interest which theretofore had been obscured, both by the Commission's earlier "public notice" and by the order.

Acting under instructions not concurred in by me, the Commission's Secretary thereafter withheld my dissent from publication by the Commission while the majority prepared an opinion attempting to explain their position in the case. After post-dating it to April 12, the Secretary published my dissent on that date, and the majority opinion was published five days later, on April 17, while I was in Canada fulfilling a speaking engagement. This procedure, involving the post-dating of my dissent which had not been agreed to by me, created a situation giving the unavoidable impression that the dissent and the majority opinion had been exchanged for examination by the respective authors prior to publication, and that arguments made in the majority opinion and unanswered in the dissent were either unanswerable or were acceptable to me.

That any such impression can only be wholly false is clear from the foregoing statement of the facts.

Further, as I shall show, the focus of the majority opinion was so narrowly directed toward rationalization of the majority's position, rather than toward the public interest, that it repeatedly distorted the facts, the law, and common

*Initial dissent printed *supra*, p. 631.

logic and, as an end result, virtually emasculated Section 204 of the Federal Power Act which sets forth the Commission's responsibilities with respect to security issues. Since this was the first and only occasion on which the Federal Power Commission has ever expatiated on its powers and duties under Section 204, this unfortunate series of circumstances has resulted in publication of a majority opinion virtually repealing that portion of the Federal Power Act, while serving as a precedent for nonfeasance in the future even more scandalous if possible, than that of the past.

In the months which have intervened since publication of the majority opinion it has already served as a reference-guide for examiners, for staff members, and for Commissioners themselves who wish to avoid the duties and responsibilities in service of the public interest spelled out clearly by the Congress in the Federal Power Act.

In these circumstances I have the unavoidable duty, in behalf of the public interest, of commenting further in this matter. In doing so it is not my purpose to prolong or exacerbate the controversy, but to bring all aspects of this matter into proper perspective for the benefit of those who may refer to this case and its important issues in the future.

In an attempt to explain their refusal to discharge a duty Congress assigned this Commission, my colleagues have repeatedly misstated my position. Contrary to their claim, I never suggested that "the Commission should have withheld its approval" of and "should have scheduled a hearing" on a $55 million security issue, "merely because a small fraction of the proceeds [estimated by the majority at $1.5 million, or 2.7% of the total issue] are to be devoted to the construction of facilities * * * for a future use which may not materialize."

Throughout our deliberations, as my colleagues well know, I raised no question regarding the undertakings to be financed with the bulk of the issue. I was concerned, and I remain concerned, solely with the question of whether or not the expenditure of an estimated $1.5 million to enlarge the proposed Klamath Falls-Round Mountain tie-line is compatible with the public interest. I was unable, and I remain unable, to state the confines of that concern more clearly than I did in my first dissent, viz:

> It is * * * impossible to reject the line out of hand as being uneconomic, imprudent or otherwise incompatible with the public interest. There simply is no record on which to base either approval or rejection. I therefore have not advocated rejection of the project in the present proceeding and I do not advocate rejection now.
>
> * * * * * * *
>
> What I have advocated, and what I believe is clearly required by Section 204 (a), (b) and (c) of the Federal Power Act, is careful investigation and genuine opportunity for a hearing to determine whether the line is "compatible with the public interest" * * *

As this was the sole and separable question of the case, its determination did not require us to delay the remainder of the issue. The sections of the Act referred to above specifically give us the power to separate a single project for detailed investigation; to withhold approval of the expenditure of capital for such a project pending completion of the investigation; and to approve the issuance of capital securities and the expenditure of the proceeds on all *other* projects while such an investigation takes its course. That is the procedure—and it is the *only* procedure—which I advocated in this case.

Regardless of the "politically controversial" nature of such an inquiry, our statutory responsibility and oath of office require us to consider questions which

can only be answered by such an inquiry. The majority's obdurate refusal to inquire cannot be concealed by distorting my position.

But the more serious result of the majority's position is not their refusal to determine whether "the construction of facilities * * * for a future use which may not materialize" is "compatible with the public interest." Nor is it the majority's refusal to define or even discuss "the public interest" as a standard. The more serious result is that—acting on behalf of the Federal Power Commission, and in the first and only exposition this Commission ever made of Section 204—the majority have totally discarded "the public interest" as a standard, despite its unobscurable presence in the statute!

Section 204(a) clearly and with no trace of ambiguity states that before it may approve a security issue this Commission must satisfy itself that the specific undertaking to be financed—

(1) is lawful, and

(2) that the company is legally authorized to perform it, and

(3) that its performance "*will be compatible with the public interest,*" and

(4) that it will be consistent with the proper performance of public utility service, and

(5) that it will not impair the company's ability to serve as a public utility.

As each of these constitutes an independent standard, we are legally forbidden to approve an issue unless we can find, in fact as well as in fine-spun legal theory, that the proposed undertaking meets *each* test.[1]

Obviously, the fact that Congress refused to prescribe an alternative standard—one under which the Commission could have approved or disapproved an undertaking in its discretion—in no way diminishes the Commission's *duty* to determine whether a proposed issue meets the five standards Congress *did* prescribe. Nor does it diminish the Commission's authority and *duty* to disapprove an issue if the undertaking fails to meet any one of the five standards, each of which has a separate efficacy.[2]

In their anxiety to avoid decisional responsibility, the majority have perverted the public law. The first two and one-half pages of their statement describe the application and staff's "careful examination" thereof. Then, after explaining for three pages that the test of "public convenience and necessity" is more discretionary than the test of "the public interest," they rule that we need not apply "the public interest" test because Congress rejected the discretionary test of "public convenience and necessity"! Specifically, the majority opinion rules

---

[1] The Commission, of course, must make the additional finding that "such issue * * * is reasonably necessary or appropriate" for an undertaking if it satisfies each of the five prior standards.

[2] As introduced, the bill that contained what became Title II of the Federal Power Act (S. 1725 and its House companion H.R. 5423, 74th Cong. 1st) made no reference to "the public interest" whatsoever, or to any of the other standards, in what is now Section 204 (bill Section 206).

Instead, the bill provided at Sec. 204 (of the original) that: "No public utility shall undertake the construction of or extension of any facilities * * * unless and until there shall first have been obtained from the Commission a certificate that the present or future public convenience and necessity require or will require such new construction * * *." As this authorized the Commission to exercise precedent, unrestrained certificating authority over *all* utility construction for interstate purposes, the securities section merely stated that utilities could only issue securities for authorized purposes.

But the Senate and House Commerce Committees chose not to vest unconfined certificating power in this Commission. Accordingly, they deleted the certificating section in its entirety, and inserted five specific standards in the securities section instead. (See S. 2796, in the nature of a substitute for S. 1725, as reported by each Committee and as passed.)

that, "in testing a security issue by the statutory standard," the Commission need only satisfy itself that the specific undertaking to be financed—

(1) is lawful,
(2) that the company is legally authorized to perform it, and
(3) that it will not impair ("squander") the company's ability to serve as a public utility.

As can be seen, this ruling is in flat and flagrant opposition to the law.

The remainder of the majority's statement consists of a series of question-begging assertions that this Commission is not empowered to determine whether a publicly-owned interconnection should be constructed (a determination I have never suggested we should or could make), or whether the company's proposed interconnection should be used to transmit surplus Bonneville power to the Pacific Southwest (another determination never suggested by me), plus an assertion that applicant's proposal is not "totally improvident."[3] It concludes with references to the desirability of an effective regional tie-line, the alleged "harmony" of applicant's proposal with certain of the Bonneville Power Administration's engineering recommendations, and an explanation (which does not explain) why the Notice herein did not give notice.

The majority refused to consider, discuss, or acknowledge—and labored to obscure—the only question of the case: namely, whether or not it is in "the public interest"[4] for a company, in the face of an effective prohibition against the export of surplus Bonneville power and in order to protect its private monopoly position, to expend capital underwritten by the ratepayers in a risky attempt to prevent the construction of an admittedly needed extra-high-voltage regional intertie by the construction of a designedly inferior substitute. Management here, as in all similar cases, obviously considers the risks justified as a means of achieving the ends chosen by management; but the question is whether these means or these ends should be imposed on the ratepayers who must ultimately pay the bill. Our duty is to answer that question. And abdication is not an acceptable substitute for a duty discharged.

In an attempt to extract from the majority some sort of lucid exposition of their refusal to answer the question I included the following passage in my dissent:

> Another favorite thicket of the utility lawyer defending practices such as those under discussion here is the argument that no interference with an enterprise such as this one is proper because the impact of the actions complained of is not sufficient to bankrupt the company even if the worst

---

[3] The majority tested the proposal by (only) three standards. It says the question "is whether from an economic standpoint * * * an investment incontrovertibly within the lawful corporate purposes of the Applicant—represents a totally improvident business decision." But the majority did not apply the economic test either, having previously ruled that "whether [a publicly-owned] interconnection would * * * remove any economic justification for Applicant's proposed expansion * * * [is] not for us to decide." Instead, as a substitute for the investigation it refused to make, it merely provided a series of hollow official recitals, such as: "we have no reason to think" that the investment would be "totally improvident"; "this Commission estimated only last January that the demand for electric energy in 1980 will be 3.75 times the requirements in 1960"; and so on. This orotund approach will not prevent undertakings "which make *impossible* the proper and *most* economic performance of public utility functions." (Sen. Rept. 621, 74th Congress, emphasis supplied.) In sum, the majority declined to scrutinize the matter at all.

[4] Apart from its quotation of the statute, and its attempt (both footnoted) to obscure the court holding that says this Commission must require "full disclosure of all material facts" before it can find a proposed undertaking "compatible with the public interest," the majority barely mentions "the public interest" standard.

consequences were to ensue, and the effect upon the individual rate-payer, while not exactly a happy one, would not be disastrous.

This begs the question and raises a smokescreen of sophistry into the bargain. There is a principle involved here, and a supremely important one. How can we condone practices on a limited scale which, if indulged on a larger scale, would unquestionably threaten the solvency of an entire utility system? Where is the line of demarcation beyond which 'tolerable' practices become intolerably dangerous?

Here too the respected regulatory agencies have refused to be led down the primrose path. There are industries, particularly in the extractive mineral field, wherein gambling is such an essential and customary part of their business practices that the courts have, without prejudice, likened them to a poker game. The electric utility industry has never been considered one of these. It should not become one under the aegis of the Federal Power Commission.

The majority's response to this was dramatic, if nothing else. After boldly retreating from one of the plain standards set up by Section 204(a) of the Act (requiring us to "find," before approving an issue of securities, that the project on which the proceeds are to be expended will not "impair" the performance of public utility service), the majority erected their own standard in its place by fancifully embroidering the standard set up by Congress. This new standard turned out to be a banner with a strange device indeed. Under it the majority see no need to examine a particular project unless it is "so improvident, frivolous and speculative that it threatens to squander the corporate substance without reasonable hope of return" or is "a totally improvident business decision." One can only predict that snow and ice will prevail in the nether regions for many years before the members of this Commission discover any need to venture forth in battle for the public interest under that banner—nor is it altogether impossible that this very prediction played a part in the design of the new standard.

The background facts, as evident to the majority at the time they wrote their opinion as now, clearly indicated that this proposal might very easily serve to prevent the distribution and sale of electric power at the lowest possible cost to the public of the Pacific Coast regions.[5] Obviously, a proposal which on its

[5] The realities, "extra record" though they necessarily must be (there being no record), were and remain as follows: (a) the export of seasonally-surplus Bonneville power to California markets is necessary to preserve the continuance of low Bonneville rates; (b) before it can be exported, legislation is probably necessary to prevent the preference clause from operating in such fashion as to create chaos in the existing BPA marketing area; (c) upon the enactment of such legislation, passed by the last Senate but not considered by the House, an extra-high-voltage transmission line, planning funds for which have been appropriated, may be constructed to convey surplus Bonneville power to California, and surplus Central Valley Project power to the Northwest; (d) the purpose of the proposed substitute line is to foreclose later construction of the designedly superior Federal line; (e) the inferior line has not been made available to wheel surplus power between Bonneville and California; (f) no demonstration has been made that it will effectively integrate the two power-producing and marketing regions; (g) the success of applicant's grand design may force an increase of Bonneville rates; (h) this Commission must approve Bonneville's rates; and (i) those rates must be set at levels designed "to extend the benefits of an integrated transmission system and encourage the equitable distribution of the electric energy developed at * * * Bonneville," 16 USCA 832c. A complete discussion of each of these elements appears in the documents cited in footnote 2 at dissent page 633; and again in the hearings on S. 3153 in the 87th Congress before the Senate Subcommittee on Irrigation and Reclamation, and in hearings on the Bonneville inter-tie planning funds before the House and Senate Appropriations Committees. Some of these matters lie within our jurisdiction and some do not. But all of them affect and are affected by the public interest. An understanding of them is necessary to an understanding and identification of the public interest.

face raises the possibility that it may militate against "an abundance of electricity at the lowest possible cost," cannot be *presumed* to be "compatible with the public interest."[6] Those background facts plainly signaled a situation that should be investigated thoroughly, and set for hearing if necessary, for the purpose of determining whether the operation of the undertaking, *as proposed*, would be "compatible with the public interest" and "consistent with the proper performance . . . of services as a public utility," or could be made "compatible" and "consistent" therewith by the exercise of our conditioning power.[7]

The standard of "the public interest" is not surplusage or Congress would not have placed it in the statute. Its meaning is contained within the four corners of the Act of which Section 204 is a part (not the railroad law). Its statutory environment shows that the standard of the "public interest" by which the subject proposal must be tested, and with which it must be "compatible," is that method of "interconnection and coordination" which will assure, or at least not frustrate or preclude, "an abundant supply of electric energy * * * with the greatest possible economy and with regard to the proper utilization and conservation of natural resources."[8] As a matter of fact, its legislative history shows that the attainment and safeguarding of the public's interest in this particular matter was the primary reason for enacting Title II of the Federal Power Act. Senate Report No. 621 of the 74th Congress made this unequivocally clear. It said—

> The necessity for Federal leadership in securing planned coordination of the facilities of the industry which alone can produce an abundance of electricity at the lowest possible cost has been clearly revealed in the recent reports of the Federal Power Commission, the Mississippi Valley Committee and the National Resources Board * * * The new part 2 of the Federal Water Power Act seeks to bring about * * * regional coordination * * *

The "precise nature of the interests" that should have been "* * * safeguarded by this Commission in passing upon * * *" the subject application,[9] therefore, is the public interest in an "abundance of electricity at the lowest possible cost," and calls for careful scrutiny of any undertaking under our jurisdiction which may be incompatible with, or designed to prevent, the attainment thereof.

In addition to several misstatements of my position herein, the majority employ a variety of additional devices to justify their somewhat self-conscious refusal to consider this matter. First they say "we should not attempt to substitute our judgment for that of management." The answer is that Congress long ago found that management decisions in the electric power field often are contrary to the public interest; and that Congress established and directed this Commission to substitute its judgment for all management decisions that are not compatible with the public interest.

Next, the majority say they did not feel that a hearing would "illuminate any material issue." The answer to that is that our scheme of Government, including the Federal Power Act, presumes that the facts upon which *decisions affecting major issues of public policy* must be based are rarely known until a public hearing is held in which all interested parties may participate; and that such decisions should not be made *in camera* and without public notice. Pre-

[6] The issue is not that applicant failed to demonstrate that its proposal will "promote" the public interest or provide a "public benefit," *Pacific Power & Light* v. *FPC*, *infra*. The question is whether applicant's undertaking "will be compatible with the public interest" as defined by the entirety of the Federal Power Act.

[7] "Section 204(b) The Commission, after opportunity for hearing, may grant any application under this section in whole or in part, and with such modifications and upon such terms and conditions as it may find necessary or appropriate, * * *."

[8] Sec. 201(a) and Sec. 202 (a)–(d).

[9] *Pacific Power & Light* v. *Federal Power Commission*, 111 F. 2d 1014 at 1017 (1940).

sumably the countless public and private officials who journeyed to Washington, both before and after the majority acted on this matter, for the sole purpose of testifying before Congress for and against the proposed Federal line would have had at least a few words to offer, if a hearing had been held regarding the extent to which the substitute line was, or by our conditioning power could be made, "compatible with the public interest."

Next, the majority say they did not hold a hearing on the substitute line because it involved "political and policy" considerations which this Commission cannot consider. The answer is that the Federal Power Commission is a political entity; its seats are occupied by political appointees; and they serve for the purpose of deciding matters affected by and affecting public policy. If this is a bad thing, which I deny, it is very late in the game to begin worrying about it now.

Next, the majority say they did not hold hearings because "no objections were raised to the proposed issue." The answer, as the majority explain, is that the public and its officials were not notified.

Next, the majority say that the Chairman of the Washington Utilities and Transportation Commission withdrew the strong request for safeguarding conditions which he immediately filed after learning that, in this innocuous "securities" matter, the FPC proposed to determine whether the substitute line was "compatible with the public interest." Specifically, the majority say that his telegram was "superseded and withdrawn" by a later letter. The answer to this is that it is simply not true. No such letter is in the docketed files on this matter, and it is hard to see how one ever could have been, because the Chairman of the Washington Utilities and Transportation Commission never wrote such a letter.

Next, the majority say that a hearing would have been inappropriate because "procedures for considering securities issues must be expeditious." (But they "reject" any suggestion that their expedition was indistinguishable from haste.) The answer is that Congress directed this and other regulatory agencies to hold hearings, if necessary, to determine whether an undertaking to be financed with the proceeds of security issues is "compatible with the public interest"; and that other agencies do so.

Finally and principally, the majority seek to clothe their refusal to investigate in those respectable outer garments which, though threadbare, are sought after more avidly than sables in situations such as this. I refer to legalisms. Specifically the majority allege that, because the Interstate Commerce Commission interprets Section 20 (a) of the Transportation Act of 1920 narrowly, this Agency must therefore interpret Section 204 (which is patterned after Section 20 (a)) in a narrow fashion. Arguing their point, the majority quote "the leading historian" of the ICC as stating that the: "* * * dominant purpose [of Section 20 (a)] was to maintain a sound structure for the rehabilitation and support of railroad credit * * * "

There are several answers to this claim, but two will do.

(1) In the first place, when they issued their opinion the majority refrained from saying that it was Sharfman they were quoting; or from what part or portion of his massive multi-volume work on the ICC they excerpted the interior portion of one paragraph which formed their quotation. Had they done so,[10] they would have enabled their audience to find quickly that in the very next paragraph, Sharfman explains that—

> The considerations set up for the Commission's guidance are stated in very general, and somewhat vague terms. The Commission is directed to ap-

[10] Specifically, I. L. Sharfman, the Interstate Commerce Commission, Vol. 1 at p. 190.

prove the application and authorize the proposed transaction only if it finds it to be, first, for some lawful object within the carrier's corporate purposes, *compatible with the public interest*, which is necessary or appropriate for or consistent with the proper performance of service to the public as a common carrier and will not impair its ability to perform that service, and second, reasonably necessary and appropriate for this purpose. It thus appears that *large discretionary control is vested in the Commission* not only over the amount and character of new issues of railroad securities and of new assumptions of financial responsibility, but *over the uses to which the proceeds of securities are to be put* and over the direction of intercorporate agreements involving financial liabilities. In other words, *the purposes* as well as the expedients of permanent financing *are subjected to the Commission's approval and authorization, with provision for following through the disposition of the proceeds.* In order that essential financial projects may not fail for want of complete compliance with the statutory standards, the Commission is empowered not only to grant or deny any particular application, *but to grant it in part and deny it in part*, or to grant it with such modifications and upon such terms and conditions as it may prescribe. [Emphasis supplied.]

(2) The second answer to the majority's misreading of the law on this matter, is that the Interstate Commerce Commission has the power to issue certificates of convenience and necessity, and in the exercise of that power it holds extensive hearings before approving each certificate application for railroad construction. Consequently a proposed construction undertaking has been thoroughly investigated (under a different section of the Act) before that Commission is called upon to approve the issuance of securities to finance it, and the results of that prior investigation substitute for or supplement the investigation that it makes under Section 20(a). In other words, the scope of an actual inquiry by the ICC under Section 20(a) is not necessarily a measure of the scope of the inquiry authorized thereby; and that Commission's practice in no way limits the scope of the inquiry we are authorized and directed to make under the statutory counterpart of Section 20(a). The following excerpts from the decisions of the ICC itself make this clear:

> We are required to make investigation of securities before authorizing their issue.[11]
>
> Our powers, in the public interest, to grant or withhold approval of security issues are broad.[12]
>
> In any application to us for authority to issue securities, we are bound to measure the proposal by the test of the public interest in whatever phase that interest may appear to be affected.[13]

And, from the Supreme Court of New York:

> Whatever may be the language used in its decisions, it is clear that when the [Interstate Commerce] Commission is called upon to approve the issuance and sale of securities under § 20a it has felt itself free, and properly so, to exercise its own independent judgment for that of the directors where in its opinion the public interests would best be served thereby. * * * Obviously, it would be futile [for an applicant] to propose a security issue which the Commission would be bound to disapprove as

[11] *In the Matter of Wheeling & Lake Erie Railway Company*, 67 ICC 293 (1921).
[12] *In the Matter of New York, Chicago, and St. Louis Railroad Company*, 79 ICC 581 at 585 (1923).
[13] *Stock of New Jersey, Indiana & Illinois R.*, 94 ICC 727 at 729 (1925).

not "compatible with the public interest" or with the proper performance by it of service to the public.[14]

In sum, the majority's attempt to obscure the unobscurable intent of Section 204 of the Federal Power Act by an overlay of legalisms simply will not do.

Neither will the attempt, although it is understandable, to brush aside the Virginia commission's refusal to shirk its statutory duty in a similar situation. In that case the Virginia commission refused to approve an issue of securities by an electric utility on the ground that the facilities to be financed thereby would not be "in the public interest." If I understand their position correctly, the members of the majority imply the case is "inapposite" because that Commission possessed the power to issue or deny certificates of convenience and necessity when it held that the issue was not "in the public interest" *as determined under its security-approval statute!* The majority have misread the case.

The case involved the 1934 Public Securities Law of Virginia (7 Va. 56–75). "The 1934 statute is concerned *only* with the issuance of securities," the Virginia commission explained, and it "says this commission *must* grant the authority applied for unless it finds that the loan is not 'reasonably necessary' to carry out one or more of the [public utility] purposes set forth in the application" (emphasis supplied). The Commission then went on to find that the application "filed *December 12, 1949*" and on which "public hearings began *April 24, 1950*," was not "in the public interest." [Emphasis supplied.]

It is true that the Virginia Code now provides the Virginia commission with the (additional) power to issue certificates of convenience and necessity. Specifically, it states at Section 50–265.2 that—

> It shall be unlawful for any public utility to construct, enlarge or acquire, by lease or otherwise, any facilities for use in public utility service * * * without first having obtained a certificate from the Commission that the public convenience and necessity require the exercise of such right or privilege. Such certificate shall be issued by the Commission only after formal or informal hearing and after due notice to interested parties.

But below, at Section 56–265.8, the law unequivocally states that such certificating authority—

> * * * shall not apply to or in any way affect any proceeding before the * * * Commission on or before *July first, nineteen hundred fifty.* [Emphasis supplied.]

One has only to read that date and compare it with the filing date and date of commencement of hearings before the Virginia commission to agree with my statement that in the particular case, the Virginia commission was "armed only with the power of approval or disapproval over security issues" and that it "used that power to prevent construction." The majority in this case were not willing to use that power to initiate an inquiry. *There* is the difference between the two cases.

The majority opinion includes numerous statements irreconcilable with the facts, which I have neither the time nor the inclination to comment on in detail. The following sentence is selected only as an example. In it the majority assert: "The record indicates that the [applicant's] new intertie will provide for the exchange of energy between the two systems and *will be available for use by the Bonneville Power Administration or other utility companies in the Pacific Northwest.*"

---

[14] *Casey* v. *Woodruff, et al.*, 49 N.Y.S. 2d 625 at 640 (1944).

In the first place there was and is no "record" indicating the foregoing, or, for that matter, anything else. In the second place there is only one intelligible reading of that sentence, particularly the portion I have emphasized. It indicates that P.P. & L. and P.G. & E. have offered to allow the use of excess line capacity *by other public and private power agencies* for wheeling their own power to their own wholesale customers over the companies' line. I have made every possible effort to substantiate this statement, including discussions with company officials, and every effort has ended in a finding that the statement was and still is in flat contradiction of the facts. The companies have, indeed, offered to be the sole *purchasers* and *sellers* of power between the two regions but they have *not* made the line available to other agencies in a genuine wheeling agreement. At this date there appears to be every reason to believe they never will. Let me add that the public interest would probably benefit materially if this prognostication should later prove to be wrong, but as of now it is very far from wrong. Construction of the line has not yet begun, more than eight months after hurried approval of securities, because of the companies' inability to obtain permits to build across public lands, and there is reason to believe that the permits are being withheld as the direct result of the companies' refusal to share costs and benefits of the line in the public interest. This is not the impression conveyed by the sentence I have quoted from the majority's opinion.

The foregoing is set forth as a caution to attorneys and scholars reading this case, so that they may examine asserted facts with care. As can be seen, some of them are not facts.

The majority make much of the undeniable fact that our jurisdiction over security issues of electric companies is limited by the peculiar wording of the Federal Power Act. It is certainly true that many electric companies are required to expose their security issues—and the projects to be financed thereby—to our scrutiny either not at all or only because of rather irrelevant factors having to do with place of incorporation and the like. But that is no reason for us to refuse to exercise the jurisdiction, spotty and sketchy though it may be, which Congress *has* seen fit to give us, and which we could and should have exercised in this case. Nor is there any reason in the public interest for our failing to call the attention of Congress to the inadequacies of the statute which the majority opinion outlined. No move has been made toward doing so in the eight months since the majority opinion was published. One finds it hard to escape the conclusion that the majority failed to take action in this case not because they lacked the power but because they preferred inaction then and have continued to prefer it since.

The same is true with respect to our lack of certificating power over such newly important developments as long-distance extra-high-voltage regional interties. I will not lengthen this dissent by a recital of the many ways in which the new transmission technology may now affect the public interest for good or ill in this vital field. The very case here discussed is a fairly illustrative, though by no means a complete, example. Suffice it to say that the technological and economic circumstances affecting the public interest are now radically different from those in which the Congress, in 1935, decided not to grant certificating authority to us. Bills which would close this gap for the protection of the public were introduced in the last session of the Congress. We have been asked to support those bills and I believe we should. But in the eight months since publication of their opinion the majority herein have made no move and have spoken no word in support of those bills despite the present inadequacies of the statute which they themselves have pointed out.

In this case we have been faced with a clear choice: like the Virginia commission in the case cited above we could have used the tools we already have, inadequate though they might prove to be in *other* cases, while asking that we be provided with the additional tools necessary for full protection of the public interest in *all* cases. Or we could, as the majority have done with superb illogic, point to the missing tools (and some which are *not* missing) as an excuse for refusal to use the ones we have, and then conspicuously refrain from asking that the missing tools be supplied.

The latter course was chosen by the majority in this case. I respectfully suggest that it is not good enough. The public interest, like the law available to us but not employed in this case, looms large to those who search for it. If the public is to be given the protection from monopoly which it deserves and expects, the law must eventually match the public interest. I believe the law adequately enabled us, in the public interest, to dispose of the issues posed by this case. In the future the law must be changed so that it matches the public interest in *every* case, and ***the law must be used.***

APPLICATIONS OF PRODUCERS OF NATURAL GAS FOR CERTIFICATES OF PUBLIC CONVENIENCE AND NECESSITY DISPOSED OF DURING THE PERIOD OF JANUARY 1, 1962 THROUGH JUNE 30, 1962; SERVICE BEGINNING SUBSEQUENT TO JUNE 7, 1954
